## 2-(1,2,3,4-Tetrahydrocarbazol-2-yl)butylamine

The title compound, $\mathrm{C}_{16} \mathrm{H}_{22} \mathrm{~N}_{2}$, consists of a carbazole skeleton with a butylamine side chain at position 2 . Molecules are linked about inversion centres by $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds [ $\mathrm{N} \cdots \mathrm{N} 2.950$ (3) Å] to form centrosymmetric dimers.

## Comment

1,2,3,4-Tetrahydrocarbazole derivatives can be considered to be synthetic precursors of tetracyclic indole alkaloids. They have tricyclic ring systems with the rings named as $A, B$ and $C$ as in the strychnose type of indole alkaloids (Bosch \& Bonjoch, 1988). The possibility of synthesizing the indole type of alkaloids by substitution at different positions is currently under investigation (Patır et al., 1997).

Tetrahydrocarbazole systems are present in the framework of a number of indole-type alkaloids of biological interest (Phillipson \& Zenk, 1980; Saxton, 1983; Abraham, 1975).

The structures of tetrahydrocarbazole derivatives having different substituents at different positions of the carbazole core, e.g. 4-methylcarbazole-3-carboxylic acid, (II) (Hökelek et al., 2001), 1-benzyloxy-1,2,3,4-tetrahydrocarbazole, (III) (Hökelek et al., 2000), N-(1,2,3,4-tetrahydrocarbazole-1-yl)-2methoxyacetamide, (IV) (Hökelek \& Patır, 2000a), 2,3-dihy-dro-3-ethyl-9-(phenylsulfonyl)carbazol-4(1H)-one, (V) (Hökelek \& Patır, 2000b), $N$-(2,2-dimethoxyethyl)- $N$-(9-methoxymethyl-1,2,3,4-tetrahydrospiro[carbazole- 1,2'-[1,3]-dithiolan]-4-yl)benzamide, (VI) (Hökelek \& Patır, 1999) and 1,2,3,4-tetrahydrocarbazole-1-spiro-2'-[1,3]dithiolane, (VII) (Hökelek et al., 1994) have been the subject of much interest in our laboratory.

The title compound, (I), may be an interesting intermediate in the synthesis of tetracyclic indole alkaloids (Magnus et al., 1992).

(I)

The present structure determination of (I) was undertaken in order to understand the effects of the butylamine side chain at position 2 on the geometry of the carbazole system, and to compare the results with those of previously reported tetrahydrocarbazole derivatives.

Figure 1
An ORTEPII (Johnson, 1976) drawing of the title molecule with the atom-numbering scheme. The displacement ellipsoids are drawn at the 50\% probability level.

Figure 2
The packing diagram for (I). Hydrogen bonds are shown as dotted lines and H atoms not involved in hydrogen bonding have been omitted.

Compound (I) (Fig. 1) contains a carbazole skeleton with a butylamine side chain bonded as substituent at position 2. As can be seen from the packing diagram (Fig. 2), there are intermolecular hydrogen bonding and intermolecular contacts between the indole $\mathrm{N}-\mathrm{H}$ group and side-chain $\mathrm{NH}_{2}$ groups of the neighbouring molecules [ $\mathrm{N} 2^{\mathrm{i}} \cdots \mathrm{H} 9$ (N9) $2.096 \AA$, N9$\mathrm{H} 9 \cdots \mathrm{~N} 2^{\mathrm{i}} 172.1^{\circ}$ and $\mathrm{N} 9^{\mathrm{i}} \cdots \mathrm{H} 2 A 2.626 \AA$, $\mathrm{N} 2-\mathrm{H} 2 A \cdots \mathrm{~N} 9^{\mathrm{i}}$ $103.6^{\circ}$, respectively; symmetry code: (i) $\left.-x,-y,-z+2\right]$. These intermolecular hydrogen bonding and contacts cause dimerization of the substituted carbazole molecules. Dipoledipole and van der Waals interactions are also effective in the molecular packing. The substituent and the intermolecular interactions may cause increases in the exocyclic and endocyclic angles $\mathrm{C} 4-\mathrm{C} 4 A-\mathrm{C} 5 \mathrm{a}$ [130.8 (2) ${ }^{\circ}$ ], $\mathrm{C} 5-\mathrm{C} 5 \mathrm{a}-\mathrm{C} 4 \mathrm{a}$ [135.1 (2) ${ }^{\circ}$ ], $\mathrm{C} 2-\mathrm{C} 3-\mathrm{C} 4 \quad\left[112.2(2)^{\circ}\right]$ and $\mathrm{C} 1-\mathrm{C} 9 \mathrm{a}-\mathrm{C} 4 \mathrm{a}$ [126.4 (2) ${ }^{\circ}$ ].

The absence of any protecting group at atom N 9 causes shortening of the $\mathrm{C}-\mathrm{N}$ bonds [ $\mathrm{N} 9-\mathrm{C} 8 \mathrm{a} 1.373$ (3) $\AA$ and $\mathrm{N} 9-$ C9a 1.382 (3) $\AA$ A $]$. They are shorter than the corresponding values $[1.390(10)$ and 1.404 (9) $\AA$ ] in $N$-(2-methoxyethyl)- $N$ -(2,3,4,9-tetrahydrospiro[1H-carbazole-1,2-(1,3)dithiolane]-4yl)benzenesulfonamide, (VIII) (Patır et al., 1997) and [1.423 (5) and 1.412 (5) Å] in 2,3-dihydro-9-(phenylsulfonyl)-carbazole-4-(1H)-one, (IX) (Hökelek et al., 1994). On the other hand, $\mathrm{N} 9-\mathrm{C} 8$ a is nearly the same as, but $\mathrm{N} 9-\mathrm{C} 9$ a is longer than the corresponding values $[1.382(2)$ and $1.355(3) \AA$ in spiro[carbazole- $1(2 H), 2^{\prime}$-[1,3]-dithiolan]$4(3 H)$-one, (X) (Hökelek et al., 1998), while N9-C8a is
shorter and $\mathrm{N} 9-\mathrm{C} 9$ a is nearly the same with respect to the corresponding ones [1.396 (2) and 1.377 (2) $\AA$ ] in 9-acetonyl-3-ethylidene-1,2,3,4-tetrahydrospiro[carbazole-1, $2^{\prime}$-[1,3]di-thiolan]- 4-one, (XI) (Hökelek et al., 1999).

The butylamine side chain in (I) causes notable changes in the geometry of the carbazole core, compared with the reported values in compounds (VI), (VII), (IX), (X) and (XI) (Table 2).

In conclusion, the types of substituent groups, depending on their electron releasing/donating properties, and their bonding positions have a significant effect on the geometry of the carbazole core.

An examination of the deviations from the least-squares planes through the individual rings shows that rings $A(\mathrm{C} 5 \mathrm{a} /$ $\mathrm{C} 5-\mathrm{C} 8 / \mathrm{C} 8 \mathrm{a})$ and $B(\mathrm{C} 4 \mathrm{a} / \mathrm{C} 5 \mathrm{a} / \mathrm{C} 8 \mathrm{a} / \mathrm{N} 9 / \mathrm{C} 9 \mathrm{a})$ are nearly planar and ring $C(\mathrm{C} 1-\mathrm{C} 4 / \mathrm{C} 4 \mathrm{a} / \mathrm{C} 9 \mathrm{a})$ is not planar, with a maximum deviation for the C3 [0.340 (3) $\AA$ ] atom. These rings are also twisted with respect to each other. The dihedral angles between the best least-squares planes are $A / B=1.63$ (8), $A / C$ $=8.21$ (7) and $B / C=6.84(8)^{\circ}$. In ring $C$, the puckering parameters, i.e. the angles between the best planes $\mathrm{C} 1 / \mathrm{C} 3 / \mathrm{C} 4 /$ $\mathrm{C} 9 \mathrm{a}, \mathrm{C} 4 / \mathrm{C} 4 \mathrm{a} / \mathrm{C} 9 \mathrm{a}$ and $\mathrm{C} 1 / \mathrm{C} 2 / \mathrm{C} 3$, are $7.0(2)$ and $50.6(2)^{\circ}$, respectively. Ring $C$ has a sofa conformation with a local pseudo-twofold axis running along the midpoints of the $\mathrm{C} 2-$ C 3 and $\mathrm{C} 4 \mathrm{a}-\mathrm{C} 9 \mathrm{a}$ bonds.

## Experimental

2-(1,2,3,4-Tetrahydrocarbazole-2-yl)butyronitrile ( $5.0 \mathrm{~g}, 21.0 \mathrm{mmol}$ ) was added slowly to a suspension of lithium aluminium hydride $(2.4 \mathrm{~g}$, $62.0 \mathrm{mmol})$ in tetrahydrofuran $(50 \mathrm{ml})$ at 273 K . The reaction mixture was refluxed for 5 h under a nitrogen atmosphere, then excess of lithium aluminium hydride was destroyed with methanol-water mixture (20:1) and extracted with ethyl acetate. The organic layer was dried with magnesium sulfate and the solvent was evaporated at reduced pressure. The residue was purified by column chromatography using silica gel, ethyl acetate-methanol (9:1) to afford 4.5 g ( $88 \%$ ) of the product. The product was recrystallized from an ethyl acetate-cyclohexane mixture (m.p. 425 K ).
