#### Abstract

The title compound, $\left[\mathrm{Zn}\left\{\mathrm{Cu}\left(\mathrm{NO}_{3}\right)\left(\mathrm{C}_{17} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{2}\right)\right\}_{2}\right]$, has the central $\mathrm{Zn}^{2+}$ ion located on an inversion centre, with four bridging O atoms from two $N, N^{\prime}$-bis-(salicylidene)-1,3-propanediaminate (SALPD ${ }^{2-}$ ) ligands and one O atom from each bridging nitrate group as nearest neighbours. This arrangement constitutes a distorted octahedral coordination around the $\mathrm{Zn}^{2+}$ ion. The inversion-related terminal $\mathrm{Cu}^{2+}$ ions have irregular square-pyramidal coordinations involving two O and two N atoms of a SALPD ${ }^{2-}$ ligand and one O atom from a nitrate group in the axial position. The Zn Cu pairs are triple bridged by the SALPD ${ }^{2-} \mathrm{O}$ atoms and by the $\mathrm{O}-\mathrm{N}-\mathrm{O}$ atoms of the nitrate groups. The $\mathrm{Zn} \cdots \mathrm{Cu}$ bridging distance is 3.0017 (6) $\AA$.

[^0]
## Comment

The structure and magnetic properties of the trinuclear complex $\left[\mathrm{Zn}\left\{\mathrm{Cu}\left(\mathrm{CH}_{3} \mathrm{CO}_{2}\right)(\mathrm{SALPD})\right\}_{2}\right]$ have been reported previously (Fukuhara et al., 1990). Similar examples of trihomo- and heteronuclear complexes have . been prepared in our laboratory using different metal ions, acetate or nitrite groups, and the ligand $N, N^{\prime}$ -bis(salicylidene)-1,3-propanediamine. The structures of these complexes have also been described (Ülkü, Tahir et al., 1997; Ülkü, Ercan et al., 1997; Ercan et al., 1998; Tahir et al., 1998; Atakol et al., 1999). These triplebridged linear complexes are of interest because of their magnetic properties.

We report here a new heterometallic trinuclear complex, $\left[\mathrm{Zn}\left\{\mathrm{Cu}\left(\mathrm{NO}_{3}\right)\left(\mathrm{C}_{17} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{2}\right)\right\}_{2}\right]$, (I), which, in addition to the two O -atom bridges between a pair of metal ions, has a third bridge provided by an $\mathrm{NO}_{3}$ group. In our previously reported complexes, the third bridge was either an acetate or a nitrite group.

(I)

The central $\mathrm{Zn}^{2+}$ ion, located on an inversion centre, has a distorted octahedral coordination involving four bridging O atoms from two SALPD ${ }^{2-}$ ligands in the equatorial plane [ $\mathrm{O} 1, \mathrm{O} 2, \mathrm{Ol}^{i}$ and $\mathrm{O}^{i}$; symmetry code: (i) $-x,-y,-z]$ and an O atom from each of the two bridging nitrate groups occupying the apical positions (Fig. 1). The $\mathrm{Zn}-\mathrm{O} 1, \mathrm{Zn}-\mathrm{O} 2$ and $\mathrm{Zn}-\mathrm{O} 3$ bond lengths are 2.063 (2), 2.055 (2) and 2.188 (2) $\AA$, respectively. The $\mathrm{O}-\mathrm{Zn}-\mathrm{O}$ bond angles within the distorted octahedra range from $76.04(9)$ to $93.74(9)^{\circ}$. Owing to the inversion centre, the $\mathrm{Zn}^{2+}$ ion is in the equatorial plane.

The coordination around the terminal $\mathrm{Cu}^{2+}$ ions, related by the inversion centre, is an irregular square pyramid. The basal plane, defined by the $\mathrm{O} 1, \mathrm{O} 2, \mathrm{~N} 1$ and N 2 atoms, consists of two N and two bridging O atoms from a SALPD ${ }^{2-}$ ligand. The axial position of the square pyramid is occupied by an O atom of the bridging $\mathrm{NO}_{3}$ group. The two $\mathrm{Cu}-\mathrm{O}$ bond lengths [1.945 (2) and 1.941 (2) $\AA$ ], as well as the two $\mathrm{Cu}-$ N distances [1.964 (3) and 1.959 (3) $\AA$ ] in the basal plane, are equal among themselves within experimental error. The $\mathrm{Cu}-\mathrm{O} 4$ distance along the pyramidal axis is considerably longer [ 2.355 (3) $\AA$ ] than those observed in the basal plane. The bond angles in the five coordinated polyhedra have values between 81.5 (1) ( $\mathrm{O} 1-\mathrm{Cu}-\mathrm{O} 2$ )

Fig. 1. ORTEP-3 (Farrugia, 1997) drawing of (I). Displacement ellipsoids are drawn at the $40 \%$ probability level and H atoms are shown as small circles of arbitrary radii.
and $97.0(1)^{\circ}(\mathrm{Nl}-\mathrm{Cu}-\mathrm{N} 2)$. The $\mathrm{Cu}^{2+}$ ion is located 0.0997 (4) $\AA$ from the basal plane.

The dihedral angle between the equatorial plane around the $\mathrm{Zn}^{2+}$ ion and the basal plane around the $\mathrm{Cu}^{2+}$ ion is $25.4(1)^{\circ}$. The bridging plane is not flat. The planes through atoms $\mathrm{O} 1-\mathrm{Zn}-\mathrm{O} 2$ and $\mathrm{O} 1-\mathrm{Cu}-$ O 2 have a dihedral angle of 28.1 (2) ${ }^{\circ}$ between them. Atoms $\mathrm{Cu}, \mathrm{N} 1, \mathrm{C} 8, \mathrm{C} 9, \mathrm{C} 10$ and N 2 form a chelate ring with a chair conformation. The diagonally positioned Cu and C 9 atoms are at distances of -0.4946 (4) and 0.705 (4) $\AA$, respectively, from the least-squares plane through the remaining four atoms of the ring.

There is a $\mathrm{C} 7-\mathrm{H} 7 \cdots \mathrm{O} 5$ intermolecular hydrogen bond (details given in Table 1). The $\mathrm{Zn} \cdots \mathrm{Cu}$ distance is 3.0017 (6) $A$. The coordination in this trinuclear complex is very similar to that of the trinuclear complexes cited in the literature, although different types of metal ions and coordinating groups were employed. The choice of ligand is decisive.

## Experimental

An ammonia solution $(20 \%, 10 \mathrm{ml})$ was added to a solution of $N, N^{\prime}$-bis(salicylidene)-1,3-propanediamine ( $2.82 \mathrm{~g}, 0.01 \mathrm{~mol}$ ) in hot ethanol ( 50 ml ) and the mixture was heated to boiling. A solution of $\mathrm{CuCl}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}(0.510 \mathrm{~g}, 3 \mathrm{mmol})$ in hot water $(20 \mathrm{ml})$ was added and the resulting mixture was set aside for 2 h . The precipitated complex ( $0.343 \mathrm{~g}, 1.00 \mathrm{mmol}$ ) was then dissolved in hot dioxane ( 50 ml ) and the temperature of the solution increased to boiling. A solution of $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ $(0.150 \mathrm{~g}, 0.5 \mathrm{mmol})$ in hot methanol $(20 \mathrm{ml})$ was added to the solution. The resulting mixture was set aside for $2-3 \mathrm{~d}$, after which time the crystals which formed were filtered off and dried in air.

## Abstract

The title compound, $\left[\mathrm{Cu}\left(\mathrm{C}_{17} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{2}\right)\left(\mathrm{H}_{2} \mathrm{O}\right)\right]$, has $m$ symmetry. The Cu atom has an approximately squarepyramidal environment involving the two O atoms and two N atoms of the $N, N^{\prime}$-bis(salicylidene)-1,3-propane-

[^1]diaminate ligand and one O atom of the water molecule in the apical position. In the coordination sphere, the $\mathrm{O}-\mathrm{Cu}-\mathrm{N}$ and $\mathrm{N}-\mathrm{Cu}-\mathrm{O}$ (water) angles are 89.6 (1) and $96.7(1)^{\circ}$, respectively.

## Comment

The Schiff base reactions of aldehydes with a symmetrical amino group such as 1,3 -propanediamine or ethylenediamine are of interest because of their metal-complexing behaviour. The structure of the Schiff base complex aqua[ $N, N^{\prime}$-bis(salicylidene)-1,3propanediamine]nickel(II) has been determined previously (Elerman et al., 1993). Nickel complexes of the diamine Schiff bases generally have square-planar coordination (Akhtar \& Drew, 1982; Manfredotti \& Guastini, 1983; Radha et al., 1985; Drew et al., 1985). The title copper complex, aqua[ $N, N^{\prime}$-bis(salicylidene)-1,3propanediaminato]copper(II), (I), has the same environment.

(I)

The coordination sphere around the Cu atom in (I) is a square pyramid (Fig. 1). The copper ion is coordinated with the four equatorial positions occupied by the two N and two O atoms of the $N, N^{\prime}$-bis(salicylidene)-1,3propanediaminate ligand ( $\mathrm{SALPD}^{2-}$ ). The Cu atom is located 0.157 (1) $\AA$ from the coordination best plane ( $\mathrm{N} 1, \mathrm{~N} 1^{\prime}, \mathrm{O} 1$ and $\mathrm{O}^{\prime}$ ). The axial position of the squarepyramidal polyhedron is occupied by the O atom of the water molecule. The displacement of the O 2 atom from the basal coordination plane is 2.472 (1) $\AA$.

The metal complex has $m$ symmetry. The SALPD ${ }^{2-}$ ligand is not planar. The chelate ring composed of atoms $\mathrm{Cu} 1, \mathrm{~N} 1, \mathrm{C} 8, \mathrm{C} 9, \mathrm{C}^{\prime}$ and $\mathrm{N1}^{\prime}$ has a chair conformation. The distances of the two para-positioned

Fig. 1. PLATON99 (Spek, 1999) drawing of (I) with the atomnumbering scheme. The displacement ellipsoids are drawn at the $50 \%$ probability level. H atoms are shown as small circles of arbitrary radii.
