#### Abstract

The title compound, $\left[\mathrm{Ni}\left(\mathrm{C}_{10} \mathrm{H}_{11} \mathrm{~N}_{4} \mathrm{O}_{5}\right)_{2}\right]$, contains asymmetric Schiff base ligands. The coordination sphere around the Ni atom is a distorted octahedron, with an average $\mathrm{Ni}-\mathrm{O}$ distance of $2.072(2) \AA$ and $\mathrm{Ni}-\mathrm{N}$ distances ranging from 2.059 (2) to 2.084 (3) $\AA$. Bond angles at the Ni atom have values between 83.80 (9) and $96.93(9)^{\circ}$. The structure is stabilized through an intermolecular hydrogen-bonding network.

## Comment

In general, the Schiff base reaction of aldehydes with symmetrical amino groups such as ethylenediamine, 1,3-
diaminopropane or 1,2 -diaminobenzene involves both amino groups. Schiff bases prepared with this type of diamine are symmetrical. Nickel complexes of the diamine Schiff bases generally have square-planar coordination (Akhtar \& Drew, 1982; Manfredotti \& Guastini, 1983; Padha, Seshasayee, Ramalingam \& Aravamudan, 1985; Drew, Prasad \& Sharma, 1985; Elerman, Kabak \& Atakol, 1993). To the best of our knowledge, the title compound, (I), is the first asymmetric Schiff basenickel(II) complex obtained by a template reaction using 3,5-dinitrosalicylaldehyde and 1,3-diaminopropane.

(I)

The slightly distorted octahedral coordination around the Ni atom involves two nitrogen and one oxygen donor from each of the two ligands (Fig. 1), with imine and amine N atoms both taking part in coordination. The phenolic O atoms are mutually cis , with equal bond lengths [2.072 (1) and $2.072(2) \AA$ ], with respect to the nickel centre. The apical $\mathrm{Ni}-\mathrm{N} 1$ and $\mathrm{Ni}-\mathrm{N} 3$ bond lengths of 2.059 (2) and 2.064 (2) $\AA$ are slightly shorter than the $\mathrm{Ni}-\mathrm{N} 2$ and $\mathrm{Ni}-\mathrm{N} 4$ bond lengths of 2.084 (3) and 2.077 (2) $\AA$ in the equatorial plane. Different $\mathrm{Ni}-\mathrm{N}$ distances are expected, since these bonds are influenced by the nature of the N -donor atom and also by the chelate rings (Curtis, 1979). Unequal $\mathrm{Ni}-\mathrm{N}$ distances

Fig. 1. ORTEPII (Johnson, 1976) drawing of $\left[\mathrm{Ni}\left(\mathrm{C}_{10} \mathrm{H}_{11} \mathrm{~N}_{4} \mathrm{O}_{5}\right)_{2}\right]$ with the atomic numbering scheme. The displacement ellipsoids are drawn at the $50 \%$ probability level. H atoms are shown as small circles of arbitrary radii.
were also observed in our previously reported squareplanar coordinated Schiff base-nickel(II) complexes (Ülkü, Tahir, Uçar \& Atakol, 1996; Tahir, Ülkü, Atakol \& Kenar, 1996). Within the coordination octahedron, the maximum deviation of the bond angles from $90^{\circ}$ is 6.93 (9) ${ }^{\text {. }}$. The maximum displacement of the Ni atom from the centre of the octahedron is 0.1120 (4) $\AA$ in the direction of the O 2 atom. Each ligand provides two chelating rings to the coordination sphere. The two benzene rings make a dihedral angle of $15.2(3)^{\circ}$ with one another. Details of the hydrogen-bonding geometry are given in Table 3: although numerous intermolecular hydrogen bonds appear to stabilize the asymmetric molecule, it seems likely that the shortest of these are the most significant and the other interactions are a consequence of these. The IR spectrum of the complex is in agreement with the molecular structure; observed stretching frequencies ( $\mathrm{cm}^{-1}$ ) are $\mathrm{C}=\mathrm{N} 1646, \mathrm{~N}-$ H 3361 and 3310 , and $\mathrm{N}-\mathrm{O} 1335$ and 1300 .

## Experimental

1,3-Diaminopropane ( $0.074 \mathrm{~g}, 1 \mathrm{mmol}$ ) was added to a solution of 3,5 -dinitrosalicylaldehyde $(0.212 \mathrm{~g}, 1 \mathrm{mmol})$ in hot MeCN $(50 \mathrm{ml})$ and the mixture heated to boiling point. A solution of $\left[\mathrm{Ni}\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2}\right] .4 \mathrm{H}_{2} \mathrm{O}(2.490 \mathrm{~g}, 1 \mathrm{mmol})$ in hot methanol $(30 \mathrm{ml})$ was added and the mixture was set aside for a week at room temperature. The precipitated crystals were filtered off and found to be suitable for X-ray data collection.

Symmetry codes: (i) $x, y-1, z$; (ii) $-x, 1-y,-z$; (iii) $1-x, 1-y,-z$; (iv) $-x, 1-y, 1-z$.

The weighting scheme used was $w^{\prime}=4 F^{2} /\left[\sigma(I)^{2}+\left(p F^{2}\right)^{2}\right]$, if $F^{2}<$ cutoff $\times\left[\sigma(I)^{2}+\left(p F^{2}\right)^{2}\right]^{1 / 2}$, then the reflection is omitted ( $p=0.04$ and cutoff $=3.0$ ). All non-H atoms were refined with anisotropic displacement parameters. H atoms on C atoms were placed geometrically $0.95 \AA$ from their parent atoms and the H atoms of N 2 and N 4 were refined for a few cycles. For all H atoms, a riding model was used with $B_{\mathrm{eq}}(\mathrm{H})=$ $1.3 B_{\mathrm{eq}}(\mathrm{C}, \mathrm{N})$.

Data collection: CAD-4 Express (Enraf-Nonius, 1993). Data reduction: MolEN (Fair, 1990). Program(s) used to solve structure: SIMPEL in MolEN. Program(s) used to refine structure: LSFM in MolEN. Molecular graphics: ORTEPII (Johnson, 1976) in MolEN. Software used to prepare material for publication: MolEN.

The authors acknowledge the purchase of the CAD-4 diffractometer under Grant DPT/TBAG1 of the Scientific and Technical Research Council of Turkey.

#### Abstract

In the title compound, $\left[\mathrm{Sn}\left(\mathrm{C}_{15} \mathrm{H}_{14} \mathrm{NO}_{2}\right)\left(\mathrm{CH}_{3}\right)_{3}\right.$ ], the Sn atom has a distorted trigonal bipyramidal coordination. The three bonds to methyl groups in the equatorial plane have almost the same values [ $\mathrm{Sn}-\mathrm{C}$ range 2.106 (3)-2.113 (4) $\AA$ ], but the $\mathrm{Sn}-\mathrm{O}$ bonds in the axial positions involving one carboxyl O atom [ Snl O1 2.153 (2) Å] and another symmetry-related carboxyl O atom in the trans position [Sn1-O2 2.495 (2) A] have quite different values. The $\mathrm{O} 1-\mathrm{Sn} 1-\mathrm{O} 2$ angle is $173.60(8)^{\circ}$. Each trimethyltin group bridges two neighbouring 2-[( 2,3 -dimethylphenyl)amino]benzoate ligands via carboxyl moieties to form polymeric chains.

## Comment

Organotin carboxylates containing a six-membered ring with a heteroatom either as part of the ring skele-
ton or as an additional functional group, have various structural possibilities. Such variations depend on the nature of the heteroatom. If the heteroatom is a potential donor ligand, like $\mathrm{N}, \mathrm{O}$ or S , it increases the coordination number of the Sn atom, either intramolecularly or by forming an intermolecular interaction with the Sn atom of a symmetry-related molecule. The known examples with nitrogen as the heteroatom are: dimethylchlorotin 2-pyridinecarboxylate (Nowell, Brooks, Beech \& Hill, 1983), dicarboxylatotetraorganodistannoxane $\left\{\left[{ }^{n} \mathrm{Bu}_{2} \mathrm{Sn}^{2}\left(\mathrm{O}_{2} \mathrm{CC}_{5} \mathrm{H}_{4} \mathrm{~N}\right)\right]_{2} \mathrm{O}\right\}_{2}$ (Parulekar et al., 1989) and three $\mathrm{Me}_{2} \mathrm{Sn}$ (chelate) $)_{2}$ compounds bearing fivemembered chelate rings (Lockhart \& Davison, 1987). In the last case, when the heteroatom is away from the $\mathrm{CO}_{2}$ group (either included or attached to the ring), the intermolecular interactions result in the formation of an infinite polymeric chain, at least in the solid state, e.g. trimethylstannyl 2-furancarboxylate (Tiekink, Sandhu \& Verma, 1989). In the present case, however, the heteroatom (in the form of an amino group) connects two sixmembered rings, namely the benzoate and xylyl groups, but is itself located on the C atom adjacent to the $\mathrm{CO}_{2}$ group. The structure of the title compound, (I), was determined in order to study the influence of the N atom on the coordination number of the Sn atom.

(I)

As can be seen from Fig. 1, the central fivecoordinated Sn atom has a distorted trigonal bipyramidal environment. The three methyl groups are located in the basal plane and the more electronegative O atoms from symmetry-related carboxylate ligands occupy the axial positions. The Sn atom is 0.153 (2) $\AA$ out of the equatorial plane towards the more strongly bound O 1 atom. The three Sn - C distances are equal within experimental error $[2.106(3), 2.113$ (4) and $2.109(3) \AA$ A $]$ and are also in agreement with the values reported for related compounds. The $\mathrm{Sn}-\mathrm{O}$ bond lengths are significantly different [ $\mathrm{Sn} 1-\mathrm{O} 12.153$ (2) and $\mathrm{Sn} 1-$ O2 2.495 (2) Å]. The C-O bonds within the carboxyl group also have different lengths. The longer C4O 1 bond $[1.292(4) \AA$ A and the shorter $\mathrm{Sn}-\mathrm{O} 1$ bond [2.153(2) $\AA$ ] share the same $O$ atom and vice versa.
