## BiLDiRim

Hazırladığım tezin/raporun tamamen kendi çalışmam olduğunu ve her alıntıya kaynak gösterdiğimi taahhüt eder, tezimin/raporumun kağıt ve elektronik kopyalarının Hacettepe Üniversitesi Sosyal Bilimler Enstitüsü arșivlerinde aşağıda belirttiğim koşullarda saklanmasına izin verdiğimi onaylarım:
$\square$ Tezimin/Raporumun tamamı her yerden erişime açılabilir.
$\square$ Tezim/Raporum sadece Hacettepe Üniversitesi yerleşkelerinden erişime açılabilir.
$\square$ Tezimin/Raporumun ... yıl süreyle erişime açılmasını istemiyorum. Bu sürenin sonunda uzatma için başvuruda bulunmadığım takdirde, tezimin/raporumun tamamı her yerden erişime açılabilir.

## TEŞEKKÜR

Öncelikle eğitimim konusunda beni her zaman destekleyen ve yüksek lisans fikrini hep aklımda tutan anneme, tez yazılımı hazırlamak ve tez yazmak için zaman yaratmam konusunda bana yardımcı olan ve beni hep mutlu eden eşime, ayrıca tez konusu seçimi, tez yazım ve sonuçlandırma aşamasında beni yönlendiren, destekleyen, ve hep özgür bırakarak yaratıcı olmamı sağlayan sayın hocalarım Prof. Dr. Ş. Armağan TARIM ve Dr. Roberto ROSSI'ye çok teşekkür ediyorum.

## ÖZET

EKiCi, Emre Özgenç. Çok Çeşiti/Az Hacimli Elektronik Kart Üretimi Yapan bir Firmanin Üretim Çizelgelemesini Gerçekleştiren Karma-Tamsayı Programlaması, Yüksek Lisans Tezi, Ankara, 2013.

Çok Çeşitlilik/Az hacimli üretim yapan, birden fazla üretim safhası bulunan, her safhada birden fazla paralel kaynağı olan Hibrit Akış Atölye (HAA) alanlarında optimum üretim çizelgesi yapmak gerçek hayatta rutin ve zor bir problemdir. Bu tür üretim alanlarının optimum üretim çizelgelemeleri için literatürde bir çok özel karma-tamsayı programları mevcuttur. Bu tezde ise, çok değişkenlik/az hacimli üretim yapan, birden fazla safhası bulunan, her safhada paralel kaynakları bulunan, safhalar arasında bekleme zaman/hacim sınırı olmayan, parti bölmeye izin veren, her işin birbirinden bağımsız kurulum süresinin olduğu gerçek bir firmanın Elektronik Kart Üretim Çizelgelemesi için geliştirilen Karma-Tamsayı Modeli yer almaktadır. Bu modelde, amaç fonksiyonu; geç kalan işlerin maliyeti ve her safhadaki kapasite artırım maliyet toplamını minimum hale getirmek olarak belirlenmiştir.

## Anahtar Sözcükler

Hibrit Akış Atölye, Karma-Tamsayı Programlama, Çizelgeleme, Elektronik Kart Üretim

#### Abstract

EKiCi, Emre Özgenç. An Optimal Mixed Integer Program for Scheduling in a High Mix Low Volume Printed Wiring Board Production Company, Master's Thesis, Ankara, 2013.

Finding optimum schedules for High Mix / Low Volume, multistage Hybrid Flow Shop (HFS) areas, is regular and hard problem. For these kinds of production areas, there are many specific Mixed Integer Programs in literature. In this thesis, another Mixed Integer Program is demonstrated for a real Printed Wiring Board Production Company with specific features: High Mix / Low Volume, multistage production with parallel units, Unlimited Interstate Buffer, Allowed Lot-Splitting, Independent set-up times of each job. Objective Function of the model is minimizing sum of costs of tardy jobs and capacity increment at each stage.

## INTRODUCTION

The company that this thesis is about is ASELSAN A.Ş. Defense Systems Technologies Division Electronics Production Department and it is working according to High Mix/low Volume Production Type.

4 main stages exist for Printed Circuit/Wiring Board (PCB) assembly at Electronics Production Department;

1. SMD Assembly

At this stage, SMD components such as resistors, diodes, capacitors, transistors, integrated circuits are mounted.
2. Through Hole Component Assembly and Rework

All electronic through-hole components and electromechanical components such as connectors, heat sinks, screws, RF screens are fixed and soldered on PCB's by using different kind of soldering methods.

## 3. Functional Test

PCB's are checked if they are functioning properly in accordance with their documented specifications by using special test setups, and test equipments.

## 4. Conformal Coating and Gluing

The conformal coating process is applied to protect PCBs from degradation caused by dust, dirt, moisture, thermal cycling and exposure to solvents.

At each stage, there are parallel sources, and owing to nature of electronic production, each production order follows same routing. (From stage1 to Stage 4) In literature, these kinds of productions types are called Hybrid Flow Shop (HFS) (Gupta, 1988; VoX, 1993). This production type is frequently-used in electronic industry and it has multi-stage, parallel resources in each stage and jobs having same production flow. Therefore, this scheduling problem easily can be regarded as Hybrid Flow Shop scheduling problem with its own
additional special features. Each job has its own due-dates; each stage has its own capacity. And there are costs that company pays for tardy jobs and capacity increment.

Also, because of high variety, various Printed Wiring Board Assembly production orders come to Electronics Production Department. All of these production orders includes different release date, due date, quantity, material name, routing, documents needed, sub-materials needed. After that, capacity constraints are included manually by Shop Floor Engineer. During Manufacturing Execution stage, in line with due-dates, release-dates, and capacity min/max borders, Shop Floor Engineer schedules each production order by splitting/not splitting the batches, increasing/decreasing capacity of each stage. This process is not cost affective and totally manual. Therefore, in this thesis mainly this scheduling problem is examined, a Mixed Integer Model is developed, solved and demonstrated.

## Company Information

As a developer of state of the art Land, Air, Naval and Space technology, ASELSAN is Turkey's leading defense industry company. Since the day it was founded, ASELSAN has attached the utmost importance to R\&D activities as well as the advancement of technology, and endeavors to achieve its goal of increasing its share in the international market by taking part in international projects.

For the last four years, ASELSAN sustained its position in the world as being in the list of Top 100 Defense Companies. ASELSAN's objective is to become one of the top 50 companies in the world through the development of original and national opportunities and talents of the highest level.

## ASELSAN operates under four divisions:

Communications and Information Technologies,

Radar, Electronic Warfare and Intelligence Systems

## Defense Systems Technologies

Microelectronics, Guidance \& Electro-Optics Division.
ASELSAN operates in the fields of the design, development, production, system integration, and after-sales services of

1. Military Communications Systems
2. Radar Systems
3. Electronic Warfare Systems
4. Electro-Optic Systems
5. Navigation and Avionic Systems
6. Weapons Systems
7. Command Control Communication Computer Intelligence, Reconnaissance and Surveillance Systems
8. Naval Systems
9. Unmanned Systems
10. Traffic and Toll Collection Systems.

Production and engineering activities are realized in Macunköy and Akyurt facilities, all of them are located in Ankara.

The Communications and Information Technologies Division, Defense Systems Technologies and Radar, Electronic Warfare and Intelligence System Divisions and the headquarter are situated in Macunköy Facilities which is established on a total area of 187.000 m 2 , of which 110.000 m 2 is closed area.

Microelectronics, Guidance and Electro optics Division is situated in Akyurt Facilities, which is nearby Ankara Esenboğa Airport, is established on a total area of 232.000 m 2 , of which 54.000 m 2 is closed area.

Some part of the overall R\&D activities with respect to Communications and Information Technologies Division are carried out in Aselsan Teknokent, a premise in Middle East Technical University, which is established on a total area of $4,500 \mathrm{~m} 2$, of which $4,000 \mathrm{~m} 2$ is closed area, which is also located in Ankara.

This research is done in Defense Systems Technologies Division and focused on Electronics Production Department Scheduling Problems.

Due to defense systems market conditions, ASELSAN Defense Systems Technologies Division is an Engineer-To-Order Company and it has High Mix/Low Volume Production type.

After ASELSAN Defense Systems Technologies Division has got sales contracts, engineering activities begins. For each "Sales contract", a "Project Name" is given. During and after engineering activities, Bill of Materials is stabilized and fixed. Master Production Schedules are created and Material Resource Planning algorithms are run according to master plans. Consequently, purchase orders and production orders are created in batches. Lot-Sizing procedure is made by ERP system. All of materials are procured or produced during these stages. For instance, during this research, company has got approximately totally different 25 projects running.

## Electronic Production Department and Printed Wiring Board Assembly

In Electronic Production Department, Printed Circuit/Wiring Boards (PCBs), modules, LRU's and cables are produced by certified technicians. All personnel are trained in ESD and safety transportation. According to working shops, respected operators are certified periodically by authorized trainer regarding IPC-A-610, J-STD-001, IPC-A-620, IPC-7721/7711 standards. The production area with air conditioning and the floor completely covered with conductive dissipative material against ESD. The internal atmospheric pressure is held above that of outside to insure a dust free work place. All the work benches are covered with ESD dissipative mats.

All of multi-layer, double-sided PCBs which have surface mounted (SMD) and through-hole (leaded) components are produced according to IPC-A-610 standard.

In addition, the work benches in PCB assembly, visual inspection and repair touch up areas are equipped with overhead ionizing neutralizers. The effectiveness of the ESD preventive hardware is periodically checked using electrostatic field tester, surface resistivity tester, ground tester and wrist strap tester.

Additionally; According to the volume of production and test measurement complexity, different types of functional test methods are applied to the cable, harness, PCB, LRU and subsystems as known as manual tests methods or automated test methods. Automated test methods can be performed with general purpose or special to type automated test equipments. There are many standard test devices working between DC and up to 50 GHz frequency.

Briefly, 4 main stages exist for Printed Circuit/Wiring Board (PCB) assembly;

1. SMD (Surface Mounted Devices) assembly
2. Through-hole (leaded) components assembly and rework
3. Functional Test

## 4. Conformal Coating and Gluing

Therefore, this scheduling problem easily can be regarded as Hybrid Flow Shop scheduling problem with its own additional special features. As it is mentioned, each job has its own due-dates; each stage has its own capacity. And there are costs that company pays for tardy jobs and capacity increment.

## Research Objectives:

The aim of this thesis is to study real company scheduling restrictions and Hybrid Flow Shop scheduling models and combine them together to design a
decision support tool for scheduling jobs. Therefore objectives of this thesis can be regarded as following:

1. Analyzing Hybrid Flop Shop Scheduling Problem and special features of the company.
2. Developing a suitable model for scheduling problem of the company.
3. Evaluating the research results and making this model a part of the decision support tools of the company.

## 1. PROBLEM STATEMENT

### 1.1. PRINTED WIRING BOARD ASSEMBLY ENVIRONMENT IN THE COMPANY

In Electronic Production Area, all electronic through-hole and SMD components such as resistors, diodes, capacitors, transistors, integrated circuits are mounted and electromechanical components such as heat sinks, screws, and RF screens are fixed on PCB's.

All of these assemblies are made simply through 4 main stages.

1. SMD Assembly
2. Through Hole Component Assembly and Rework
3. Functional Test
4. Conformal Coating and Gluing

Because of High Mix/Low Volume production structure, each stage is not fully automated and some stage usually encounters labor-intensive jobs. Except SMD assembly, remaining 3 stages can be regarded as labor intensive. Regarding this situation; for 3 stages, scheduling and capacity planning is done due to labor restrictions and for SMD Assembly stage scheduling and capacity planning is done due to machine restrictions. Each stage has parallel labor and machine resources. Because of High Mix, set-up times are inevitable for this case.

Additionally, approximately 1.000 PCBs of 80 different types are produced per month in this production area.

## 1. SMD (Surface Mounted Devices) Assembly

SMD components such as resistors, diodes, capacitors, transistors, integrated circuits are mounted. There are 2 parallel SMD machines in production line. Materials are prepared and put into feeders, trays and tubes before assembly and before machine run, an assembly program which is showing the exact
locations of materials on PCB's, should be prepared. Except setup activities, this stage can be considered as machine-intensive stage. Capacity planning, scheduling is done due to SMD Machines restrictions.

Figure -1: One of SMD Machine used in SMD Assembly Process

## 2. Through Hole Component Assembly and Rework

All electronic through-hole components and electromechanical components such as connectors, heat sinks, screws, RF screens are fixed and soldered on PCB's by using different kind of soldering methods such as wave soldering system, Selective Soldering System or manual soldering.

Additionally there is an extra stage called "Component Forming, Potting and Preparing" which can be regarded as setup of this stage. In this extra stage, Component leads are cut and formed, some small mechanical parts such as pins, rivets, carriers are formed and placed on pcb, peel able solder mask material applied to PCB's prior to PCB assembly. Therefore, this stage is a setup for "Through Hole Component Assembly and Rework" stage.

This stage can be considered as labor-intensive stage. Capacity planning, scheduling is done due to labor resource restrictions.

Figure-2: Wave-Soldering Machine

Figure-3: Selective-Soldering Machine

## 3. Functional Test

PCB's are checked if they are functioning properly in accordance with their documented specifications by using special test setups, and test equipments. The PCB's that pass the test, go on the consequent stage. But the PCB's that cannot pass, are sent to previous stage for repair/rework.

This stage can be considered as labor-intensive stage. Capacity planning, scheduling is done due to labor resource restrictions.

Figure-5: Sample Test Setup (2)

Figure-4: Sample Test Setup (1)

## 4. Conformal Coating and Gluing

The conformal coating process is applied to protect PCBs from degradation caused by dust, dirt, moisture, thermal cycling and exposure to solvents. This process is applied manually or by special automatic machine

Also, In order to stabilize the large components subject to mechanical shock in operation, gluing process is applied to fix the components to each other or prevent the leakage.

This stage also can be considered as labor-intensive stage. Capacity planning, scheduling is done due to labor resource restrictions.

Figure-6: Gluing Process

Figure-7: Conformal Coating Machine

The flow of PCBs can be demonstrated briefly as at Figure-8:

Figure-8: Flow of PCB Production

### 1.2. PRINTED WIRING BOARD ASSEMBLY PLANNING AND SCHEDULING PROBLEM

Due to various Project Plans and Master Production Schedules (MPSs), Engineering Departments fix and freeze Bill of Materials (BOMs) data of Materials. Afterward, Production Planning Department runs Material Resource Planning, explodes BOMs and creates production and purchase orders regarding Project Plans and MPSs.

Lots and batches are determined during this activity. There is not a methodic lot-sizing strategy in the company. "Lot-for-Lot" Lot-Sizing method is used usually. For the cases, "Lot for Lot" method is not used, Production Planning Engineers decide the lots for each material type without regarding a common algorithm.

After material procurement activities, various production orders come to Electronics Production Department in High Mix/low Volume type.

Each production order includes a release date, due date, quantity, material name, routing, documents needed, sub-materials needed. Subsequent to production orders arrival, capacity constraints are included manually by Shop Floor Engineer. During Manufacturing Execution stage, in line with due-dates, release-dates, and capacity min/max borders, Shop Floor Engineer schedules each production order by splitting/not splitting the batches, increasing/decreasing capacity of each stage.

As it's seen, this scheduling problem has its own additional special features and can be regarded as Hybrid Flow Shop scheduling problem.

## Therefore, this scheduling problem has;

## Assumptions:

1. For each stage, setup time of each job is independent from other jobs' setup times. (Sequence - independent).

Because of Engineer to Order and High Mix/low Volume production type of company, there is no product line and grouping of products, so one type of
product do not resemble another. This causes totally different setups for each product and totally different and independent setup times for each product.
2. Some obligatory wait-times just like oven, cleaning etc. are not managed.

Wait-times are assumed that they are occurred after work-hours. These kinds of waiting times for each product make the schedules totally unmanageable. So as to manage these wait-times, the company put them often after work-hours.
3. Material handling times are not managed.

In the ASELSAN Defense Systems Technologies Division PCB Production Area, there is at most 15 meters distance and it takes at most 2 minute walk between stages. Therefore, the company neglects these material handling times in their schedules.
4. All of parallel labor and machine resources that are at the same stage are identical.

In order to formulize and calculate the capacity of each stage, company makes their schedules by neglecting differences of each resource.
5. Processing times of each job is deterministic.

In scheduling studies hold during and before production in company, process times are determined previously and if they are changed during production, all of scheduling studies are redone.
6. Lot splitting is allowed in each stage.

Lots for each production order are not determined via common algorithm. Frequently, while scheduling production orders, lots of production orders are divided into sub-lots because of capacity constraints of stages or different urgency conditions of sub-lots.
7. Raw material, tooling or infrastructure availability is not managed.

As in all scheduling problems, in order to take healthy solutions from scheduling methods, these kinds of availability problems are neglected by the company.
8. Processed units are always satisfactory.

In order to handle Reworks/Fail Processes for jobs, the company chooses to re-schedule them as another job.
9. Some sub-lots of customer order can have different due date than remaining part of customer order.

The company uses the way of re-scheduling these Sub-lots with different due dates as another job.
10. Unlimited buffer between stages.

The company has no determined space limit between and in stages.

## Given Data:

1. Release date of each job.

Every production order is coming to production area after kitting process at warehouse. Therefore, each production order has a release date. On the other hand, same date can be named as completion date of kitting process of that production order at warehouse. These release dates are determined by Production Planning Engineers in the company.
2. Due date of each job.

Production Planning Engineers determine due date of each job according to Master Production Plan and MRP.
3. Min/max capacity borders in each stage during a time period.

As a result of labor-intense stages, capacity of each stage can be changed by managers due to capacity constraints. Minimum and maximum level of
capacity for a time period is determined and capacity decisions are made due to these borders.
4. Process time and setup time of each job.

Every production order has pre-determined, deterministic process time and setup time for each stage.
5. Costs of each tardy jobs and capacity increment.

In order to make meaningful schedules, unit costs for tardy jobs and capacity increment are predetermined by managers.

## Constraints:

1. Capacity of each stage has minimum and maximum borders for labor and machine resources.
2. Every job or part of the batch has due date and release date.

## Decision Variables:

1. Start time of each stage for each job
2. Finish time of each stage for each job
3. Can batches be divided to sub-lots? Or will whole batch be processed?
4. How many capacity units used in each stage for a time-period

## Objectives:

1. Minimizing total cost of tardy jobs.
2. Minimizing total cost of capacity increments at each stage.

## A small Example of Problem:

In order to illustrate ASELSAN Defense Systems Technologies Division PCB Production Scheduling Problem, a small example with 6 production order can be examined.

| Production <br> Order \# | Stock <br> Number | Amount (Unit) | Relase <br> Date | Due Date |
| :--- | :--- | ---: | :--- | :--- |
| 1 | A | 10 | 01.01 .2014 | 08.01 .2014 |
| 2 | B | 5 | 02.01 .2014 | 08.01 .2014 |
| 3 | C | 1 | 03.01 .2014 | 06.01 .2014 |
| 4 | D | 12 | 01.01 .2014 | 08.01 .2014 |
| 5 | E | 8 | 01.01 .2014 | 07.01 .2014 |
| 6 | F | 4 | 01.01 .2014 | 08.01 .2014 |

These 6 production orders come to PCB production area, and then process times and setup times of these production orders are determined such as:

|  | Stage \# |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 |
|  | 20 | 10 | 25 | 10 |
|  | 5 | 40 | 10 | 0 |
|  | 8 | 3 | 20 | 4 |
|  | 32 | 80 | 64 | 16 |
|  | 0 | 32 | 27 | 26 |
|  | 16 | 20 | 12 | 8 |

|  | Stage \# |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| $\Sigma$ | 1 | 2 | 3 | 4 |
|  | 8 | 2 | 4 | 1 |
| $\Sigma$ | 4 | 3 | 3 | 0 |
| E | 4 | 1 | 2 | 1 |
| F | 12 | 3 | 4 | 2 |
| 烒 | 0 | 1 | 2 | 3 |
| ¢ | 8 | 2 | 1 | 1 |

Then minimum and maximum borders for capacity of each stage for each time period are determined.

|  | Capacity Borders (hr) |  |
| ---: | ---: | ---: |
| Stage \# | Minimum | Maximum |
| $\mathbf{1}$ | 8 | 32 |
| $\mathbf{2}$ | 30 | 80 |
| $\mathbf{3}$ | 20 | 50 |
| $\mathbf{4}$ | 10 | 20 |

After all, according to capacity, due date, release date constraints, a feasible schedule is found and executed manually by Shop Floor Control Engineer as following: (Please note that setup times are not included in this demonstration.)

Although it is a small example, you can see capacity-usage imbalance over time periods in the schedule. Regarding that the company schedules from 80 to 110 jobs daily, it is not hard to see the complexity of this problem. During scheduling and manufacturing execution, company faces periodically many due-date and capacity violations.

This research focuses on this complex problem and aims to develop a decision support tool for scheduling from 80 to 110 jobs for ASELSAN Defense Systems Technologies Division.

## 2. LITERATURE REVIEW

### 2.1. HYBRID FLOW SHOP SCHEDULING PROBLEM

Hybrid Flow Shop (HFS) (Gupta, 1988; VoX, 1993) is a frequently-used production type with multi-stage, parallel resources in each stage and jobs having same production flow. The queues between the various stages may be managed by various disciplines (First In First Out, Earliest Due Date etc.). HFS is named also as "Flexible Flow Shop" or "Multi-Processors Flow Shop" in literature. (M. Pinedo, 2002) A machine/labor can process at most one job at a time and a job can be processed by at most one machine/labor at a time. (Tam_as Kis, Erwin Pesch , 2005) In real world, this special production type has been used generally by the companies that have Low Volume/High Mix production. In Electronics, Foods, Textile Industries, this type can be seen broadly.

HFS production type can be demonstrated mathematically as: (Rubén Ruiz, José Antonio Vázquez-Rodríguez, 2009)
3. There should be more than one stage for production. $s>1$
4. Each stage can have more than 1 parallel resource. $\mathrm{K}>0$
5. Each job should follow same routing. stage1-> stage2 -> stage3-> ...

Batches

Figure - 9: Schematic of Hybrid Flow Shop with identical parallel units. (Yu Liu, I.A. Karimi, 2008)

HFS scheduling problem can be defined as; finding an optimal or near-optimal schedule of all jobs due to a given objective. However, HFS scheduling problem in most cases NP-Hard. (Rubén Ruiz, José Antonio Vázquez-Rodríguez, 2009)

HFS scheduling problems vary because of different industry applications and manufacturing environments. This carries different assumptions, constraints, variables, parameters and objectives to HFS scheduling problem.

In literature, for solving different kinds of HFS scheduling problem, several exact methods and heuristics methods are proposed. Additionally, for stochastic type of this problem, there are some special heuristics (metaheuristics) just like Simulated Annealing, Genetic Algorithms and Tabu Searchs etc.

Commonly, scheduling problems are classified according to shop-configuration $(\alpha)$, set of constraints and assumptions ( $\beta$ ), objective functions ( $\gamma$ ) and are denoted simply as $\alpha|\beta| \gamma$. (Rubén Ruiz, José Antonio Vázquez-Rodríguez, 2009)

Shop-configuration (a)
Shop-configuration ( $\alpha$ ) identifies the number of stages, number of machines in each stage and characteristics of machines. Parameter ( $\alpha$ ) is composed of 4 characteristics that are defined in Table 1.

Set of constraints and assumptions ( $\beta$ )
This parameter described in Table 1, demonstrates special features, constraints and assumptions of manufacturing area.

Objective functions ( $\gamma$ )

This parameter depicts the objective function type that is used for that specific scheduling problem.

| Parameters of Scheduling Problems |
| :--- |
| Shop-configuration $(\alpha)$ |

| <1 | General type of Manufacturing Area. Flow-Shop, Job-Shop, Open-Shop etc. <br> Example: FH = Hybrid Flow Shop |
| :---: | :---: |
| a2 | Number of Stages |
| 人3 and $\times 4$ | Properties of Machines in each stage <br> Example: $\alpha 3 €\{\varnothing, P, Q, R\}$ <br> $\mathrm{P}=$ identical parallel machines <br> $\mathrm{Q}=$ uniform parallel machines <br> $R$ = unrelated paralel machines <br> $\varnothing=$ single machine |
| Set of constraints and assumptions ( $\beta$ ) (Most common parameters) |  |
| $\mathrm{r}_{\mathrm{j}}$ | job j cannot start processing before its release date rj |
| prmu | jobs are processed in every stage in the same order |
| prec | there are precedence constraints between operations from different jobs. |
| $\mathrm{M}_{\mathrm{j}}$ | the processing of job j is restricted to the set of machines Mj at stage k . This is known as eligibility. |
| $\mathrm{S}_{\text {sd }}$ | the setup times are dependent on the sequence of operations. |
| prmp | preemptions are permitted. |
| block | the buffer capacities between stages are limited. The jobs must wait in the previous |

|  | stage until sufficient space is released. |
| :---: | :---: |
| recrc | jobs are allowed/required to be processed more than once in the same stage. |
| unavail | machines are not available at all times. |
| no - wait | jobs are not allowed to wait between two successive stages. |
| $\mathrm{p}_{\mathrm{j}}=\mathrm{p}$ | all processing times are equal to p . |
| Split | if batches of jobs can be devided into parts. (Larysa Burtseva, Rainier Romero, Salvador Ramirez, Victor Yaurima, Félix F. González-Navarro and Pedro Flores Perez (2012)) |
| Objective functions ( $\mathrm{\gamma}$ ) |  |
| $\mathrm{C}_{\text {max }}=\operatorname{maxj} \mathrm{C}_{\mathrm{j}}$ | maximum completion time |

Table-1 (Rubén Ruiz, José Antonio Vázquez-Rodríguez, 2009)

Therefore, as an example, a HFS scheduling problem that has;

- m stage
- parallel uniform machines at each stage
- unlimited buffer between stages
- preemption-forbidden
- release dates of all jobs
- set-up times independent from each other
- allowed-lot-splitting
- objective function that is sum of number of earliness and number of tardy jobs

$$
\begin{array}{llll}
\alpha 1 & \alpha 2 & \alpha 3 \& \alpha 4 & \beta
\end{array}
$$

can be denoted simply as $\mathbf{F H m}\left(\mathbf{P M}^{(\mathbf{k})}\right)^{\mathbf{m}}{ }_{\mathrm{k}=1} \mid \mathbf{r}_{\mathrm{j}}$, split, $\mathbf{S}_{\mathrm{nsd}} \mid \mathbf{U}+\mathbf{E}$. (Table-1)

For solving different kind of HFS scheduling problems, there are two ways proposed in literature;

1. Exact methods such as; Integer Programming and Branch \& Bound
2. Heuristics and metaheuristics such as; Complicated Dispatching Rules, Simulated Annealing, Genetic Algorithms and Tabu Search Algorithms etc.

### 2.2. SOLVING METHODS FOR HFS SCHEDULING PROBLEM

### 2.2.1. Exact Methods:

In literature, for solving HFS Scheduling problem, different type Branch and Bound (B\&B) Based Algorithms and Integer Programming Models are used widely.

B\&B Based Algorithms are briefly concentrates on canceling non-promising solutions as far as possible during the run. This decreases the branches of search tree and it helps to find optimum much easier (Ahmet Bolat, Ibrahim AIHarkan, Bandar Al-Harbi , 2005). In literature, from easier version of HFS scheduling problem (2 or 3 stages and 5-10 jobs) to hardest ones ( n stages and m jobs), various B\&B based Algorithms can be be found.

Integer programming is also often used to formulate and solve this HFS scheduling problem. Again, there are different types of Integer Programming Models for different types of HFS's. However, general HFS scheduling problem that has negligible setups, no release dates, not allowed preemption, unlimited buffer between stages, identical machines in each stage, can be formulated such as: (Rubén Ruiz, José Antonio Vázquez-Rodríguez, 2009)

Index:
j = job number
$k$ = stage number

I = machine number

## Parameters:

$p_{j k}=$ processing time required by job jin stage k
Q = Big Number

## Decision Variables:

$\mathrm{c}_{\mathrm{jk}}=$ completion time of job j in stage $\mathrm{k} . \mathrm{cj} 0=0$.
$\mathrm{Y}_{\mathrm{jk} \mathrm{l}}=1$ if job jon stage k is assigned at machine I
0 otherwise
$X_{\mathrm{j} \mathrm{rk}}=1$ if job j precedes job r on stage k
0 otherwise
minimize $Z$
s.t.

$$
\begin{equation*}
Z \geq c_{j m}, \forall j \tag{2}
\end{equation*}
$$

$$
\begin{equation*}
\sum_{l=1}^{M^{(k)}} Y_{j k l}=1, \forall(j, k) \tag{3}
\end{equation*}
$$

$c_{j k}-c_{j, k-1} \geq \sum_{l=1}^{M^{(k)}} Y_{j k l} p_{j k}, \forall(j, k)$
$Q\left(2-Y_{j k l}-Y_{q k l}+X_{j q k}\right)+c_{j k}-c_{q k} \geq p_{j k}, \forall(j, k, l, q)$ such that $j<r$
$Q\left(3-Y_{j k l}-Y_{q k l}-X_{j q k}\right)+c_{q k}-c_{j k} \geq p_{q k}, \forall(j, k, l, q)$ such that $j<r$
$Y_{j k l} \in\{0,1\}, \forall(j, k, l)$
$X_{j r k} \in\{0,1\}, \forall(j, q, k)$
$c_{j k} \geq 0, \forall(j, k)$.
Figure - 10: Basic of Hybrid Flow Shop Mixed Integer Programming Model (Rubén Ruiz, José Antonio Vázquez-Rodríguez, 2009)
$Z$ is restricted to be greater or equal to the completion time of the last operation to finish its processing, i.e., the makespan. Several other criteria will be discussed in Section 3. The set of constraints (3), guarantees that all operations are assigned strictly to one machine at each stage. Constraint set (4), restrict the starting time of operation ojk to be greate ror equal to its release time from the previous stage. Constraint sets (5) and (6) prevent any two operations from overlapping in a common machine. Constraint sets (7), (8) and (9) define the domains of the decision variables (Rubén Ruiz, José Antonio VázquezRodríguez, 2009).

Furthermore, in literature, there are Mixed Integer Programming applications for PCB Production Companies. In (Tadeusz Sawik, Andreas Schaller, Thomas M. Tirpak, 2002 and Tadeusz Sawik, 2001), there are convenient MIP applications for HFSs which have no storage or limited-storage between stages, no setup, no lot-splitting, medium to high volume and SMT (Surface Mount Technology) machines-intense features. In (Tadeusz Sawik, 2000), there is a suitable MIP application for HFS that has jobs having different routes, limited-storage between stages, no setup, no lot-splitting, medium to high volume and SMT machines-intense features. In (Tadeusz Sawik, 2002), there is a fitting MIP application for HFS that has batches of different type of units, limited-storage between stages, no setup, no batch-splitting, medium to high volume and SMT machines-intense features. Additionally, a hierarchically MIP approach to HFS scheduling problem exists in (Tadeusz Sawik, 2006). Two MIP models are demonstrated, by first MIP model, which sub production lots of customer orders has to be scheduled in the periods of time-horizon, is determined, by second MIP model, which machines in each stage are assigned to each sub production lot of customer orders, is determined. Over again, this model is created for HFSs that have no setup times, predetermined production lots for each customer order (therefore no lot-splitting via MIP modeling), medium to high volume and SMT machines-intense characteristics. Another MIP Approach and reactive scheduling algorithms exists in (Tadeusz Sawik, 2007) for HFSs that have predetermined production lots, limited-lot-splitting (lot splitting allowed only for specific pre-determined customer orders and only for two subsequent periods), no setup, often-rescheduling environment, make to orger, medium to high volume traits. Different rescheduling algorithms (REALL, REMANT, RENON etc.) are compared via computational results.

Additional to PCB Production Application, there are other MIP applications for different HFS types. In (Yu Liu, I.A. Karimi, 2008), there are slot-based and sequence based MIP approaches for HFSs that have Zero wait between stages/No Inter-stage buffer, no setup times, parallel non-identical resources/units, weighted Just In time objectives, sequence-dependent batches/jobs, no lot-splitting traits.

A convenient MIP approach for real steel company applications exists in (Stefan Voss, Andreas Witt, 2007). Similar to ASELSAN HFS Problem, this MIP application models a steel company HFS problem with characteristics; parallel identical machines, unlimited inter-stage buffer, sequence-dependent setup times, lot-splitting, minimum weighted set-up times and tardiness objectives.

Special lot-splitting MIP model for reed switch manufacturing exists in (Larysa Burtseva, Rainier Romero, Salvador Ramirez, Victor Yaurima, Félix F. González-Navarro and Pedro Flores Perez (2012)). This MIP application has traits; two stations with parallel identical machines (FH2), at first station allowed lot-splitting, sequence independent-setup times, unlimited inter-stage buffer, high-volume. Besides MIP application, lot-splitting issue is comprehensively examined.

### 2.2.2. Heuristics and Meta-Heuristics

For every type of scheduling problem in different type of industries, -from simplest to complex- heuristics and algorithms can be found in literature. Simplest heuristics in literature are dispatching rules for HFS problems. These rules are easy to use and do not need hard computational effort. They are designed for finding near-optimal solutions. As example, Johnson's rule, Kusiak's Rule, Gupta's Heuristic, Palmer's Heuristic, CDS and RA Heuristics for Flow Shop Scheduling, Earliest Due Date, Shortest Process Time Dispatching Rules are simplest ones.

By development of computer technology, some stochastic and variable elements are started to be included in algorithms. These kinds of algorithms and heuristics are called "Metaheuristics". Complicated Dispatching Rules, Simulated Annealing, Genetic Algorithms and Tabu Search Algorithms can be given as examples for this kind. (Rubén Ruiz, José Antonio VázquezRodríguez, 2009)

## 3. APPROACH AND MODEL PROPOSED

### 3.1. APPROACH

In order to formulate and develop a HFS Mixed Integer Programming Model for ASELSAN Defense Systems Technologies Division Production Area, the model that is proposed should have assumptions, constraints, given data and objective function such as:

## Assumptions:

1. HFS should have 4 stages. However, it is good to remember that an mstage model can handle this problem.
a. SMD Assembly
b. Through Hole Component Assembly and Rework
c. Functional Test
d. Conformal Coating and Gluing
2. Each stage has parallel labor and machine resources
3. Because of High Mix/low Volume, set-up times are inevitable and setup time of each job is independent from other jobs' setup times. (sequence independent)
4. Material handling times are not managed
5. Some obligatory wait-times just like oven, cleaning etc. are not managed. Wait-times are assumed that they are occurred after work-hours.
6. Material handling times are not managed.
7. All of labor and machine resources that are at the same stage are identical.
8. Processing times of each job is deterministic.
9. Lot splitting is allowed in each stage.
10. Raw material, tooling or infrastructure availability is not managed.
11. Processed units are always satisfactory. Reworks/Fail Processes for jobs should be re-scheduled as another job.
12. Some sub-lots of customer order can have different due date than remaining part of customer order. Sub-lots that have different due dates should be re-scheduled as another job.
13. Unlimited buffer between stages.

## Given Data:

1. Release date of each job
2. Due date of each job
3. Min/max capacity borders in each stage during a time period
4. Process time and setup time of each job
5. Unit Costs of each tardy job and capacity increment

## Constraints:

1. Capacity of each stage has minimum and maximum borders for labor and machine resources.
2. Every job or part of the batch has due date and release date.

## Decision Variables:

1. Start time of each stage for each job
2. Finish time of each stage for each job
3. Can batches be divided to sub-lots? Or will whole batch be processed?
4. How many capacity units used in each stage for a time-period

## Objectives:

Minimizing total cost of tardy jobs.
Minimizing total cost of capacity increments at each stage.
Therefore for simple notation, this kind of HFS scheduling problem, can be denoted simply as;

## FHm ( $\left.\mathbf{P M}^{(k)}\right)^{m}{ }_{k=1} \mid r_{j}$, split, $S_{\text {nsd }} \mid \mathbf{U}+$ Total Capacity

And ASELSAN Defense Systems Technologies Division simply waits from this research to adopt a decision support tool that is finding optimal schedules in line with due dates and release dates of all jobs (from 80 up to 110) at four stages via using lot-splitting and capacity increase/decrease decisions.

MIP model that is included in (Stefan Voss, Andreas Witt, 2007) an be considered as a fit model for ASELSAN's HFS Scheduling Problem because the model has traits; parallel identical machines, unlimited inter-stage buffer, sequence-dependent setup times, lot-splitting, minimum weighted set-up times and tardiness objectives. The MIP model proposed in (Stefan Voss, Andreas Witt, 2007) includes sequence-dependent setup times and lot-splitting by using model approach in (Haase, K., 1994), minimum weighted set-up times and tardiness objectives different to the MIP model that is proposed in (Talbot, F.B., 1982). This model is prepared for a steel company HFS problem.

On the other hand, it is good to remember that, different from the model in (Stefan Voss, Andreas Witt, 2007), ASELSAN Defense Systems Technologies Division HFS Scheduling problem has sequence-independent setup times and allowed-capacity decrease/increase attribute.

The model in (Stefan Voss, Andreas Witt, 2007) is;
FHm (PM $\left.{ }^{(k)}\right)^{m}{ }_{k=1} \mid$ split, $S_{s d} \mid T^{w}$ (Stefan Voss, Andreas Witt, 2007)

## Index:

j = job number
$j=1, \ldots . . J+1$

| t | $=$ each time period | $\mathrm{t}=1, \ldots . \mathrm{T}$ |
| :--- | :--- | :--- |
| m | $=$ stage number | $\mathrm{m}=1, \ldots . \mathrm{M}$ |
| $r$ | $=$ resource number in each stage | $r=1, \ldots . \mathrm{R}$ |
| a | $=$ setup state of resource $r$ | $a=1, \ldots . \mathrm{A}_{r}$ |

## Parameters (Given Data):

$d_{j, m} \quad=$ process time of job j in stage m
$\mathrm{d}_{\mathrm{j}}, \quad=$ total process time of job j
$P_{j} \quad=$ immediate predecessors of a job $j$
$\mathrm{S}_{\mathrm{j}} \quad=$ immediate successors of $\mathrm{a} j \mathrm{job} \mathrm{j}$
T = Time Horizon
$d d_{j} \quad=$ due date of job $j$
$w t_{h, m}=$ waiting time for predecessor job $h$ of job jin mode $m$
Earliest Start Time
$\begin{array}{rlrl}E S T_{j}=0 & \text { if } P_{j}=\{0\} ; \\ & \operatorname{Max}\left(\left(E S T_{h}+d_{h}\right) h \in P_{j}\right) & \text { otherwise }\end{array}$
Latest Start Time
$\mathrm{LST}_{\mathrm{j}}=\mathrm{T}-\mathrm{d}_{\mathrm{j}}$
$\operatorname{Min}\left(\left(L S T_{k}-d_{j}\right) k \in S_{j}\right)$
if $\mathrm{j} \epsilon \mathrm{P}_{\mathrm{j}+1}$ otherwise
$\mathrm{c}_{\mathrm{j}, \mathrm{m}, \mathrm{r}, \mathrm{a}}=$ capacity consumption of job j in stage m at resource r of setup state a
$s c r_{r, b, a}=$ setup cost matrix from b setup state to a setup state for resource $r$
$s c r_{r}{ }^{\text {max }}=$ maximum setup cost that is incurred at resource $r$
$s t_{r, a}=$ minimal time that setup state a requires at resource $r$

## Decision Variables:

$C_{r, t}=1$ if $r$ resource is working at period $t$
0 not-working or break-down
$x_{\mathrm{j} ; \mathrm{m} ; \mathrm{t}}=1 ; \quad$ if job j is completed in period t in mode $\mathrm{m} ;$
$0 ; \quad$ otherwise
$\mathrm{SC}_{\mathrm{r}, \mathrm{t}}=\quad$ setup cost incurred at resource r in time period t
$\mathrm{Y}_{\mathrm{r}, \mathrm{a}, \mathrm{t}}=1 ; \quad$ if resource r is setup in state a in period $\mathrm{t} ;$

$0 ; \quad$ otherwise

Total Model: (Stefan Voss, Andreas Witt, 2007)

Minimize $\sum_{r=1}^{R} \sum_{t=1}^{T} S C_{r, t}+\lambda * \sum_{=E F T_{j+1}}^{L E T_{j+1}} t * x_{j+1,1, t}+(1-\lambda) * \sum_{j \in P_{j+1}} \sum_{n=1}^{M_{j}} \sum_{==\max \left(E F T_{j+1}, d d_{j}\right)}^{L E T T_{j}} w_{j} *\left(t-d d_{j}\right) * x_{j, m, t}$

Subject to

$$
\begin{align*}
& \sum_{m=1}^{M_{j}} \sum_{t=E F T_{j}}^{L F T_{j}} x_{j, m, t}=1  \tag{1}\\
& j=1, \ldots . . J+1 \\
& \sum_{m=1}^{M_{h}} \sum_{t=E F T_{h}}^{L F T_{h}}\left(t+w t_{h, m}\right) * x_{h, m, t} \leq \sum_{m=1}^{M_{j}} \sum_{t=E F T_{j}}^{L E T_{j}}\left(t-d_{j, m}\right) * x_{j, m, t} \quad j=1, \ldots . . . J+1, h \in P_{j}  \tag{2}\\
& \sum_{j=1}^{J} \sum_{m=1}^{M_{j}} \sum_{\tau=\max \left(, E F F_{j},\right.}^{\min \left(t+d_{j, m}-1, L F T_{j}\right)} c_{j, r, a} * x_{h, m, \tau} \leq C_{r, t} * y_{r, a, t} \quad r=1, \ldots \ldots R \quad t=1, \ldots T \quad a=1, \ldots . . A_{r}  \tag{3}\\
& \sum_{a=1}^{A} y_{r, a, t}=1 \quad r=1, \ldots \ldots R \quad t=1, \ldots T  \tag{4}\\
& S C_{r, t}-s c_{r}^{\max } * y_{r, a, t}+\sum_{b=1}^{A+}\left(s c_{r}^{\max } * y_{r, b, t-1}-s c_{r, b, a} * y_{r, b, t-1}\right) \geq 0 r=1, \ldots . . R \quad a=1, \ldots . . A_{r} \quad t=1, \ldots T  \tag{5}\\
& \sum_{v=t}^{t+s t_{r}-1} y_{r, a, v} \geq s t_{r, a}\left(y_{r, a, t}-y_{r, a, t-1}\right) \quad r=1, \ldots . . R \quad a=1, \ldots . . A_{r} \quad t=1, \ldots T  \tag{6}\\
& S C_{r, a, t} \geq 0 \quad r=1, \ldots \ldots . . \quad a=1, \ldots . . A_{r} \quad t=1, \ldots T \\
& y_{r, a, t} \in\{0,1\} \quad r=1, \ldots . . R \quad a=1, \ldots \ldots A_{r} \quad t=1, \ldots T \\
& x_{j, m, t} \in\{0,1\} \quad j=1, \ldots . . J+1 \quad m=1, \ldots . . M_{j}, \quad t=1, \ldots T \\
& 0 \leq \lambda \leq 1
\end{align*}
$$

It's seen that; objective function of the model composes of three elements. First one is, total setup change cost in each resource at each time period. Second one is, weighted total completion time of each job therefore makespan. Third one is weighted total tardy jobs. (Stefan Voss, Andreas Witt, 2007)

First constraint (1) is providing each job is completed exactly once during time horizon (T). Second constraint (2) ensures precedence relation of each job with other jobs and adding a waiting time to each job's process time for cooling time of heated materials. Third constraint (3) prohibits capacity violations in each time period for each resource and each setup state. Fourth constraint (4) assures every resource to have only one setup state in each period. Fifth constraint (5) provides that a variable setup cost occurs if a resource (r) changes its setup state from $a$ to $b$ from the period $t-1$ to $t$. Sixth constraint (6) is about a special case for steel company which is;" if a resource change its setup state from 1 to 3 than there is no job of transition 2 state available. Therefore, whenever this kind of case occurs, this constraint implies setup times with duration of zero or minimum str,a." (Stefan Voss, Andreas Witt, 2007)

As a result, this model decides each time period that each job is completed and each time period that each resource at each stage changes its setup state by minimizing sum of total setup cost, weighted total completion time and weighted total tardy jobs. (Stefan Voss, Andreas Witt, 2007)

This model is most approximate proposed-model in literature for ASELSAN Defense Systems Technologies Division HFS Scheduling problem. Also, it should be mentioned that the model in (Stefan Voss, Andreas Witt, 2007) is more comprehensive than model that is demonstrated in this thesis. And it includes a complicated solution for a harder scheduling problem than ASELSAN has. However, regarding two primary points, it is clear that this model cannot be directly applied to ASELSAN Defense Systems Technologies Division. It should be converted for special case of the company. First thing to change is, the company's HFS problem has setup-independent trait which means each job has independent setup time from other jobs in each stage because of company's High Mix / Low Volume issue. Second one is; the company has three labor-intensive stages (Through Hole Component Assembly and Rework, Functional Test and Conformal Coating and Gluing) and one machine-intensive stage (SMD Assembly). Therefore, ASELSAN Defense Systems Technologies Division wants to schedule all jobs due to labor-intense
constraints too. And capacity increase/decrease in each stage is allowed, probable and frequently used.

For that reason, a new model approach is needed for this special case and this is what this research is all about.

### 3.2. MODEL PROPOSED

As mentioned before, simply ASELSAN Defense Systems Technologies Division waits from this research to adopt a decision support tool that is finding optimal schedules in line with due dates and release dates of all jobs (from 80 up to 110) at four stages via using lot-splitting and capacity increase/decrease decisions.

This Hybrid Flow Shop Scheduling Problem starts with arrival of various production orders to Electronics Production Department in High Mix/low Volume type. Each production order includes a release date, due date, quantity, material name, routing, documents needed, sub-materials needed. Subsequent to production orders arrival, capacity constraints are included manually. During Manufacturing Execution stage, in line with due-dates, release-dates, and capacity min/max borders, each production order in time horizon ( $T$ ) is scheduled by splitting/not splitting the batches, increasing/decreasing capacity of each stage.

In order to comprehend all these assumptions, constraints and objectives of ASELSAN Defense Systems Technologies Division Hybrid Flow Shop Scheduling Problem, we start with dividing scheduling time horizon $(T)$ to equal time periods as it is mentioned in (Stefan Voss, Andreas Witt, 2007). This equal time periods can be regarded as 1 work-day, 1 work-hour or 4 work-hours etc. and it should be determined before. For ASELSAN's case, 4 work-hours time period and $60 \times 4$ Work - Hours = 30 Days Time Horizon will be used. This will ease to handle entire HFS problem.

Additionally, for the company's case, it will be good to think of process times of each job for all stages in terms of pre-determined equal time periods. Therefore, process time matrix is converted from hour or second based process time to this pre-determined time periods based process times. For instance;

First matrix is converted to second one by rounding up values as it is demonstrated below.

| Process Time Matrix (Hour-Based) | Stage \# |  |  |  |  | Process Time Matrix (Pre-determined Time Period = 4-hours) | Stage \# |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Job \# | 1 | 2 | 3 | 4 |  | Job \# | 1 | 2 | 3 | 4 |
| 1 | 8 | 12 | 16 | 4 |  | 1 | 2 | 3 | 4 | 1 |
| 2 | 4 | 2 | 4 |  |  | 2 | 1 | 1 | 1 | 2 |
| 3 | 8 | 9 | 6 |  |  | 3 | 2 | 2 | 2 | 1 |

This process-time conversion and pre-determined time periods provides our model to handle the capacity and lot-splitting notion. In order to understand this special scheduling problem easily, the Figure-11 can be used. As it's seen, there are four important assumptions to make the problem easier.

1. Every job has process times at each stage in terms of pre-determined time-periods.
2. In each period, there is capacity limits for all stages and if these capacity limits are exceeded, capacity-cost occurs.
3. At all stages, batches of jobs can be divided into minimum sub-lots and sub-batches which's total process time at that stage should be equal to pre-determined time period.
4. At every lot-split occasion, setup time occurs again. Therefore, for our new model, setup cost will balance lot-splitting occasions.

It is important to add that same should be applied to setup times and setup times should be converted from hour or second based setup time to this predetermined time periods based setup times.

| time period\# |  |  |  |  |  |  |  |  |  |  |

Figure- 11: Easy schematic of ASELSAN Defense Systems Technologies Division Hybrid Flow Shop Scheduling Problem

It is easy to see that these assumptions make it easier to develop a Mixed Integer Programming Model for ASELSAN Defense Systems Technologies Division Hybrid Flow Shop Scheduling Problem, solve it and obtain optimal schedules of all jobs (from 80 to 110 jobs).

Considering ASELSAN Defense Systems Technologies Division Hybrid Flow Shop Scheduling Problem as whole, major indexes in the proposed model are:
j = job number
t = each time period
s = stage number
$j=1, \ldots \ldots . J+1$
$t=1, \ldots . . T$
$s=1, \ldots . S$

There are parameters (given-data) given by the company and used in the model and they are:
$\mathrm{p}_{\mathrm{j}, \mathrm{s}} \quad=$ process time of job j in stage s
$S T_{j, \mathrm{~s}}=$ setup time of job j in stage s

T = Time Horizon
$r d_{j} \quad=$ release date of job j
$d d_{j} \quad=$ due date of job $j$
$\operatorname{minC}_{s, t} \quad=$ minimum capacity level at each stage and in each time period $\operatorname{maxC}_{s, t} \quad=$ maximum capacity level at each stage and in each time period
$\operatorname{pbin}_{\mathrm{j}, \mathrm{s}} \quad=1$ if there is a process time of job j at stage s
0 otherwise

TH = Time Horizon

CC= Capacity cost for each increment

TJC = Cost paid for each Tardy job

BigM = Big number

The model that is proposed in this research begins with finding decision variables. Most important decision variable is;
$X_{j, s, t}=1 ; \quad$ if $s$ th stage of job j is being done in period t ;

0 ; otherwise
This decision variable is used mainly for capacity limitations, process time limitations, setup costs determination and lot-splitting. If $\mathrm{X}_{\mathrm{j}, \mathrm{s}, \mathrm{I}}=1$, this means "one time period part" of process time of $s$ th stage of job $j$ is done during the period t . If $\mathrm{X}_{\mathrm{j}, \mathrm{t}, \mathrm{t}}=0$, then there is not work-done in the period t for sth stage of job j.

Another important decision variable is;
$\mathrm{S}_{\mathrm{j}, \mathrm{s}, \mathrm{t}}=1$; if a setup occurs at s th stage of $j o b \mathrm{j}$ is completed in period t 0 ; otherwise

This acts like balancing variable for lot-splitting or not decisions. By adding setup cost for each lot-splitting event to objective function will force the model to balance these lot-splitting events. For each stage of each job, If $\mathrm{X}_{\mathrm{j} ; \mathrm{s}, \mathrm{t}-\mathrm{i}}$ equals to 0 and $X_{j ; s, t}$ equals to 1 then $\mathrm{S}_{\mathrm{j} ;, \mathrm{s}, \mathrm{t}}$ will be 1 . Else $\mathrm{S}_{\mathrm{j} ; \mathrm{s}, \mathrm{t}}$ will be 0 in the model.

Capacity decision variable is another positive integer decision variable;
$\mathrm{C}_{\mathrm{t}, \mathrm{s}}=$ capacity at each stage in t th time period.
In each time period, there is a minimum level of capacity for each stage, and maximum level of capacity of each stage. This variable cannot exceed maximum level for each stage and each time period. And if this variable takes a value bigger than minimum level, company is paying capacity increment cost for the amount of ( $\mathrm{C}_{\mathrm{t}, \mathrm{s}}$ - minimum leve $\mathrm{I}_{\mathrm{t}, \mathrm{s}}$ ).

Finish time positive integer decision variable is:
$\mathrm{F}_{\mathrm{j}} \quad=$ Completion time of j th job .
This is exact time of completion time of each job.
Tardy Job decision variables are:
$\mathrm{TA}_{j}=1$; if Finish time is greater than due date of each job. $\left(\mathrm{F}_{\mathrm{j}}>\mathrm{dd}_{\mathrm{j}}\right)$

## 0 ; otherwise

These binary variables act for balancing costs of tardy jobs.
As mentioned before ASELSAN Defense Systems Technologies Division aims to minimize total cost of tardy jobs and minimize total cost of capacity increments at each stage. Therefore, proposed model in this research has an objective function contains three of them but weights them using different costs for them. (CC and TJC.)

First one is for total cost of tardy jobs;
$\sum_{j=1}^{J} T J C * T A j$
Second one is for total cost of capacity increments;
$\sum_{j=1}^{J} \mathrm{CC} *\left(\mathrm{C}_{\mathrm{t}, \mathrm{s}}-\operatorname{minC}_{\mathrm{t}, \mathrm{s}}\right)$

For third one, this part also forces the model for using 0 resources (below the minimum capacity border) as much as possible at each stage and in each time period.

Therefore; our exact objective function is:
$Z=\sum_{j=1}^{J} T J C * \mathrm{TAj}+\sum_{j=1}^{J} \mathrm{CC} *\left(\mathrm{C}_{\mathrm{t}, \mathrm{s}}-\operatorname{minC}_{\mathrm{t}, \mathrm{s}}\right)$

In order to achieve real-life assumptions and obstacles of ASELSAN Defense Systems Technologies Division Hybrid Flow Shop Scheduling Problem, model has important constraints such as following.

1. Every job has to be finished before time horizon $\mathrm{T}+1$.

This is handled easily by;
$F_{j} \leq T \quad j=1, \ldots ., J \quad$ (1)
2. Completion time of each job is calculated by finding biggest time period which has the value of $X_{j, s, t}=1$. And also if there is a setup time (if $\mathrm{S}_{\mathrm{j}, \mathrm{s}, \mathrm{t}}=1$ ) at that time period, it should be added to found value.

This is formulated as;
$\left(X_{j, t, s} * t\right)+\left(S_{j, t, s} * S T_{j, s}\right) \leq F_{j} \quad j=1, \ldots ., J \quad t=1, \ldots . T \quad s=1, \ldots . S$
3. Process times of each job at each stage should be matched with given process time values. For each job and each stage, this is ensured by equalizing sum of $X_{j, s, t}$ from beginning of time period ( $t=1$ ) to time horizon $(T)$ to given process times.

$$
\begin{equation*}
\sum_{t=1}^{T} X_{j, t, s}=p_{j, s} \quad j=1, \ldots ., J \quad s=1, \ldots ., S \tag{3}
\end{equation*}
$$

4. If a lot-splitting event occurs in the schedule, a setup time should occur in that time period when a divided sub-lot begins its work. Assume that there is a work in a period of a job's stage, $\mathrm{X}_{\mathrm{j}, \mathrm{s}, \mathrm{t}}=1$. If there is not a work in one period before that time period ( $\mathrm{t}-1$ ) of that job's stage ( $\mathrm{X}_{\mathrm{j}, \mathrm{s}, \mathrm{t}-1}=0$.) then there is a setup cost in that period ( t$) \mathrm{S}_{\mathrm{j}, \mathrm{s}, \mathrm{t}}=1$. For all other cases, setup time will not occur. (Otherwise, $\mathrm{S}_{\mathrm{j}, \mathrm{s}, \mathrm{t}}=0$ )

So as to understand easily, the following table can be examined.

| $\mathrm{X}_{\mathrm{j} ; \mathrm{s}, \mathrm{t}-1}$ | $\mathrm{X}_{\mathrm{j} ; \mathrm{s}, \mathrm{t}}$ | $\mathbf{S}_{\mathrm{j} ; ; ; \mathrm{t}}$ |
| :--- | :--- | :--- |
| 1 | 1 | $\mathbf{0}$ |
| 1 | 0 | $\mathbf{0}$ |
| 0 | 1 | $\mathbf{1}$ |
| 0 | 0 | $\mathbf{0}$ |

Table 2: Setup Cost Table

And this is handled by the model as following:

$$
\begin{equation*}
X_{j, t, s}-X_{j, t-1, s} \leq S_{j, t, s} \quad j=1, \ldots ., J \quad t=1, \ldots . T \quad s=1, \ldots . S \tag{4}
\end{equation*}
$$

5. Given release dates of all jobs should be met. If there is a process time at jth job's sth stage $\left(\mathrm{pbin}_{\mathrm{j}, \mathrm{s}}=1\right)$, all of $\mathrm{X}_{\mathrm{j}, \mathrm{s}, \mathrm{t}}$ 's should be 1 after release dates of jobs ( $\mathrm{t} \geq \mathrm{rd}_{\mathrm{j}}$ ).

This is assured by:

$$
\begin{equation*}
\operatorname{pbin}_{j, s} * X_{j, t, s} * r d_{j} \leq t * X_{j, t, s} \quad j=1, \ldots ., J \quad t=1, \ldots . T \quad s=1, \ldots . S \tag{5}
\end{equation*}
$$

6. Maximum border of capacity $\left(\max _{\mathrm{t}, \mathrm{s}}\right)$ for each stage ( s ) and in each time interval ( t ) should be met.

This is assured by:

$$
\begin{equation*}
C_{t, s} \leq \max C_{t, s} \quad t=1, \ldots . T \quad s=1, \ldots . S \tag{6}
\end{equation*}
$$

7. If finish time of a job $\left(F_{j}\right)$ is bigger than due date of a job $\left(d_{j}\right)$, then a tardy job occurs and for that job, tardy job variable $\left(T_{j}\right)$ should be 1 . Due to this is a minimization problem, this is handled by using Big $M$ method as following:

$$
\begin{equation*}
F_{j}-d d_{j} \leq B i g M * T A_{j} \quad j=1, \ldots . J \tag{7}
\end{equation*}
$$

8. Variable Capacity of each stage in each period should be bigger than or equal to work-load of total jobs on that stage during that period. Workload is calculated with total sum of $\mathrm{X}_{\mathrm{j}, \mathrm{s}, \mathrm{t}}$ 's (Process Time-Load) and $\mathrm{S}_{\mathrm{j}, \mathrm{s}, \mathrm{t}} \mathrm{X}$ $S T_{j, s}$ (if setup occurs ( $\mathrm{S}_{\mathrm{j}, \mathrm{s}, \mathrm{t}}=1$ ) then setup-time load occurs) for every job at each stage and in each period.

This is ensured by:

$$
\begin{equation*}
\sum_{j=1}^{J}\left(X_{j, t, s}+\left(S_{j, t, s} * S T_{j, s}\right) \leq C_{t, s} \quad t=1, \ldots ., T \quad s=1, \ldots ., S\right. \tag{8}
\end{equation*}
$$

9. Because of lot-splitting issue, stages of jobs have different prerequisite conditions. There are S-1 different conditions and constraints for a start of a stage. In this research for ASELSAN Defense Systems Technologies Division, it is considered that $S=4$ is enough. Therefore, mainly 3 different conditions are examined and added.
a. If a job has process time at current stage (s) and following stage $(\mathrm{s}+1)$. (If pbin $\mathrm{j}_{\mathrm{j}, \mathrm{s}}=1$ and $\mathrm{pbin}_{\mathrm{j}, \mathrm{s}+1}=1$ ) The subsequent stage of current stage cannot start before a sub-lot of job finishes its work at current stage. Therefore, subsequent stage looks for only if some part of preceding stage finishes. In order to see easily, figure in the below demonstrates that $(\mathrm{s}+1)^{\text {st }}$ stages (in red marks) do not wait for accomplishment of total work at preceding stage and do not start before preceding stage.

| time period \# |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Job \# | Stage \# | 1 | 2 | 3 | 4 | $\square>$ |  | T-1 | TIME HORIZON =T |
|  | S1 | 1 |  |  | 1 |  |  |  |  |
|  | S2 |  |  |  |  |  |  |  |  |
|  | S3 |  |  | 1 |  | 1 |  |  |  |
| 1 | S4 |  |  |  |  | 1 | 1 |  |  |
|  | S1 |  | 1. | - | 1 |  |  |  |  |
|  | S2 |  |  | 1 |  |  | 1 |  |  |
|  | S3 |  |  |  |  |  |  |  |  |
| 2 | S4 |  |  |  |  | 1 |  |  | 1 |
|  | S1 |  | 1 | 1 |  |  |  |  |  |
|  | S2 |  | $\xrightarrow{\square}$ | 1 | 1 | 1 | 1 |  |  |
|  | S3 |  |  |  |  | 1 | 1 |  |  |
| 3 | S4 |  |  |  |  |  |  | 1 |  |
|  | S1 |  |  |  |  |  |  |  |  |
|  | S2 |  |  | 1. | $\longrightarrow$ | 1 |  |  |  |
|  | S3 |  |  | $\bigcirc$ | 1 | 1 |  | 1 |  |
| 3 | S4 |  |  |  |  |  | 1 |  | 1 |
|  | S1 |  |  |  |  |  |  |  |  |
| $\}$ | S2 |  |  |  |  |  |  |  |  |
|  | S3 |  |  |  |  |  |  |  |  |
| J-1 | S4 |  |  |  |  |  |  |  |  |
|  | S1 |  |  |  |  |  |  |  |  |
|  | S2 |  |  |  |  |  |  |  |  |
|  | S3 |  |  |  |  |  |  |  |  |
| J | S4 |  |  |  |  |  |  |  |  |

Figure-12: Simple Examples for Constraint 9.a
In order to formulize this condition $\left(\mathrm{pbin}_{\mathrm{j}, \mathrm{s}}=1\right.$ and $\mathrm{pbin}_{\mathrm{j}, \mathrm{s}+1}=1$ case), for each job, partial work at preceding stage (s) should be done at least one period before
$\mathrm{s}+1^{\text {st }}$ stage starts. For instance, imagine that at time period $\mathrm{t}+1$, in order to start $\mathrm{s}+1^{\mathrm{st}}$ stage $\left(\mathrm{X}_{\mathrm{j}, \mathrm{s}+1, \mathrm{t}+1}=1\right)$, at least one of $\mathrm{X}_{\mathrm{j}, \mathrm{s}, 1}, \mathrm{X}_{\mathrm{j}, \mathrm{s}, 2}, \mathrm{X}_{\mathrm{j}, \mathrm{s}, 3} \ldots, \mathrm{X}_{\mathrm{j}, \mathrm{s}, \mathrm{t}-1}, \mathrm{X}_{\mathrm{j}, \mathrm{s}, \mathrm{t}}$ should be equal to 1 . Therefore this can be visualized as following:

Figure-13: Visualization Of Constraint 9.a
Consequently, this constraint can be added to the model easily as following:
$\sum_{t=1}^{t=t \mid} X_{j, t, s} \geq \operatorname{pbin}_{j, s} * X_{j, t 1+1, s+1} j=1, \ldots, J \quad t 1=1, \ldots, T-1 \quad s=1, \ldots, S$
b. If a job has process time at current stage (s) and following ( $\mathrm{s}+2)^{\mathrm{nd}}$ stage. (If $\mathrm{pbin}_{\mathrm{j}, \mathrm{s}}=1$ and $\mathrm{pbin}_{\mathrm{j}, \mathrm{s}+2}=1$ ). This constraint is added in order to handle a special case that if $(s+1)^{\text {st }}$ stage has not a process time. By this constraint, start of $(\mathrm{s}+2)^{\text {nd }}$ stage before a sub-lot of job finishes its work at $s^{\text {th }}$ stage is forbidden. In order to see easily, figure in the below demonstrates that ( $\mathrm{s}+2)^{\text {nd }}$ stages (in red marks) do not start before partial finish of $s^{\text {th }}$ stage and do not wait for accomplishment of total work at $s^{\text {th }}$ stage.

| time period \# |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Job \# | Stage \# | 1 | 2 | 3 | 4 | $\square$ | $\cdots$ | T-1 | TIME HORIZON = T |
| 1 | S1 | 1 | - |  | 1 |  |  |  |  |
|  | S2 | - |  | $\xrightarrow{ }$ |  |  |  |  |  |
|  | S3 |  | $\bigcirc$ | 1 |  | 1 |  |  |  |
|  | S4 |  |  |  |  | 1 | 1 |  |  |
| 2 | S1 |  | 1 |  | 1 |  |  |  |  |
|  | S2 |  |  | 1 |  |  | 1 |  |  |
|  | S3 |  |  | , |  | $\cdots$ |  |  |  |
|  | S4 |  |  |  | > | 1 |  |  | 1 |
| 3 | S1 |  | 1 | 1 |  |  |  |  |  |
|  | S2 |  |  | 1 | 1 | 1 | 1 |  |  |
|  | S3 |  |  |  |  | 1 | 1 |  |  |
|  | S4 |  |  |  |  |  |  | 1 |  |
| 3 | S1 |  |  |  |  |  |  |  |  |
|  | S2 |  |  | 1 |  | 1 |  |  |  |
|  | S3 |  |  |  | 1 | 1 |  | 1 |  |
|  | S4 |  |  |  |  |  | 1 |  | 1 |
| J-1 | S1 |  |  |  |  |  |  |  |  |
|  | S2 |  |  |  |  |  |  |  |  |
|  | S3 |  |  |  |  |  |  |  |  |
|  | S4 |  |  |  |  |  |  |  |  |
| J | S1 |  |  |  |  |  |  |  |  |
|  | S2 |  |  |  |  |  |  |  |  |
|  | S3 |  |  |  |  |  |  |  |  |
|  | S4 |  |  |  |  |  |  |  |  |

Figure-14: Simple Examples for constraint 9.b
As visualized in Figure 13 for Constraint 9.a, similarly this constraint is constructed such as:

$$
\begin{equation*}
\sum_{t=1}^{t=t 1} X_{j, t, s} \geq \operatorname{pbin}_{j, s} * X_{j, t l+1, s+2} j=1, \ldots ., J \quad t 1=1, \ldots, T-1 \quad s=1, \ldots ., S \tag{9.b}
\end{equation*}
$$

c. If a job has process time at current stage ( $s$ ) and following $(s+3)^{\text {rd }}$ stage. (If $\mathrm{pbin}_{\mathrm{j}, \mathrm{s}}=1$ and $\mathrm{pbin}_{\mathrm{j}, \mathrm{s}+3}=1$ ). This constraint is added in order to handle a special case that if $(s+1)^{\text {st }}$ and $(s+2)^{\text {nd }}$ stage
have not process times. By this constraint, start of $(\mathrm{s}+3)^{\text {rd }}$ stage before a sub-lot of job finishes its work at $\mathrm{s}^{\text {th }}$ stage is forbidden. In order to see easily, figure in the below demonstrates that $(s+3)^{\text {rd }}$ stages (in red marks) do not start before partial finish of $s^{\text {th }}$ stage and do not wait for accomplishment of total work at $\mathrm{s}^{\text {th }}$ stage.

Figure-15: Simple Examples for constraint 9.c
As visualized in Figure 13 for Constraint 9.a, similarly this constraint is constructed such as:

$$
\begin{equation*}
\sum_{t=1}^{t-t 1} X_{j, t, s} \geq \operatorname{pbin}_{j, s} * X_{j, t l+1, s+3} j=1, \ldots, J \quad t 1=1, \ldots, T-1 \quad s=1, \ldots, S \tag{9.c}
\end{equation*}
$$

These three constraints strictly arrange starting periods of each stage of every job. In order to visualize it, these constraints force the schedule to be like in Figure 16. Constraints construct an imaginary line such as red lines in the Figure 16 for each stage of every job which works as a minimum border of starting points of each stage.

| Job \# | Stage \# | 1 | 2 | 3 | 4 | $\square$ | $\rightarrow$ | T-1 | TIME HORIZON =T |

| J | S4 |  |  |  |  |  |  |  |  |

Figure-16: Schedule Visualization after Constraints 9.a, 9.b and 9.c.
10. For finishing of process times at each stage, there are also S-1 different conditions and constraints. And, in this research for ASELSAN Defense Systems Technologies Division, it is considered that $\mathrm{S}=4$ is enough. Therefore, mainly 3 different conditions are added.
a. If a job has process time at current stage (s) and following stage $(\mathrm{s}+1)$. (If $\mathrm{pbin}_{\mathrm{j}, \mathrm{s}}=1$ and $\mathrm{pbin}_{\mathrm{j}, \mathrm{s}+1}=1$ ) The subsequent stage cannot end before current stage finishes all of job's work. Therefore, subsequent stage ends after all work of preceding stage finishes. In order to see easily, figure in the below demonstrates that $(s+1)^{s t}$ stages (in red marks) do waits for accomplishment of total work at preceding stage and do not end before preceding stage.

Figure-17: Simple Examples for constraint 10.a
In order to formulize this condition $\left(\mathrm{pbin}_{\mathrm{j}, \mathrm{s}}=1\right.$ and $\mathrm{pbin} \mathrm{j}_{\mathrm{j}, \mathrm{s}+1}=1$ case), for each job, all of work at preceding stage (s) should be done at least one period before $\mathrm{s}+1^{\text {st }}$ stage ends. For instance, think that at time period $\mathrm{t}+1$, in order to finish $s+1^{\text {st }}$ stage (total sum of $X_{j, s+1,1,}, X_{j, s+1,2,}, X_{j, s+1,3} \ldots, X_{j, s+1, t}, X_{j, s+1, t+1}=P_{j, s+1}$, total sum of $X_{j, s, 1}, X_{j, s, 2}, X_{j, s, 3} \ldots, X_{j, s, t-1}, X_{j, s, t}$ should be equal to $P_{j, \mathrm{~s}}$ ) at least one period before. Therefore, in order to finish $\mathrm{s}^{\text {th }}$ stage at $\mathrm{t}^{\text {th }}$ time period, at least one of $\mathrm{X}_{\mathrm{j}, \mathrm{s}+1, t+1}, \mathrm{X}_{\mathrm{j}, \mathrm{s}+1, \mathrm{t}+2}, \mathrm{X}_{\mathrm{j}, \mathrm{s}+1, \mathrm{t}+3} \ldots, \mathrm{X}_{\mathrm{j}, \mathrm{s}+1, \mathrm{~T}-1}, \mathrm{X}_{\mathrm{j}, \mathrm{s}+1, \mathrm{~T}}$ equals to 1 . Because $\mathrm{s}+1^{\text {th }}$ stage always should finish after than $\mathrm{s}^{\text {th }}$ stage. This can be visualized as following:

Figure-18: Visualization Of Constraint 10.a
Consequently, this constraint can be added to the model easily as following:

$$
\sum_{t=t l+1}^{t=T} X_{j, t, s+1} \geq \operatorname{pbin}_{j, s+1} * X_{j, t 1, s} j=1, \ldots ., J \quad t 1=1, \ldots, T-1 \quad s=1, \ldots ., S \quad \text { (10.a) }
$$

b. If a job has process time at current stage (s) and following stage ( $\mathrm{s}+2$ ). (If $\mathrm{pbin}_{\mathrm{j}, \mathrm{s}}=1$ and $\mathrm{pbin}_{\mathrm{j}, \mathrm{s}+2}=1$ ) This constraint is added in order to handle a special case that if $(\mathrm{s}+1)^{\text {st }}$ stage has not a process time. The $(\mathrm{s}+2)^{\text {nd }}$ stage cannot end before current stage ( $\mathrm{s}^{\text {th }}$ stage) finishes all of job's work. Therefore, $(s+2)^{\text {nd }}$ stage ends after all
work of $s^{\text {th }}$ stage finishes. In order to see easily, figure in the below demonstrates that ( $s+2)^{\text {nd }}$ stages (in red marks) do waits for accomplishment of total work at $\mathrm{s}^{\text {th }}$ stages and do not end before $s^{\text {th }}$ stages.

Figure-19: Simple Examples for constraint 10.b
As visualized in Figure 18 for Constraint 10.a, similarly this constraint is constructed such as:

$$
\sum_{t=t+1}^{t=T} X_{j, t, s+2} \geq \operatorname{pbin}_{j, s+2} * X_{j, t 1, s} j=1, \ldots ., J \quad t 1=1, \ldots, T-1 \quad s=1, \ldots ., S \quad(10 . b)
$$

c. If a job has process time at current stage (s) and following stage $(\mathrm{s}+3)$. (If $\mathrm{pbin}_{\mathrm{j}, \mathrm{s}}=1$ and $\mathrm{pbin}_{\mathrm{j}, \mathrm{s}+3}=1$ ) This constraint is added in order to handle a special case that if $(\mathrm{s}+1)^{\text {st }}$ and $(\mathrm{s}+2)^{\text {nd }}$ stages have not process times. The $(s+3)^{\text {rd }}$ stage cannot end before current stage ( $\mathrm{s}^{\text {th }}$ stage) finishes all of job's work. Therefore, $(\mathrm{s}+3)^{\text {rd }}$ stage ends after all work of $s^{\text {th }}$ stage finishes. In order to see easily, figure in the below demonstrates that ( $s+3$ ) ${ }^{\text {rd }}$ stages (in red marks) do waits
for accomplishment of total work at $s^{\text {th }}$ stages and do not end before $\mathrm{s}^{\text {th }}$ stages.

| Job \# | Stage \# | 1 | 2 | 3 | 4 | $\square$ | $\square$ | T-1 | TIME HORIZON = T |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | S1 | 1 |  |  | 1 | $\bigcirc$ |  |  |  |
|  | S2 | $\sim$ |  |  |  |  |  |  |  |

| J | S4 |  |  |  |  |  |  |  |  |

Figure-20: Simple Examples for constraint 10.c
As visualized in Figure 18 for Constraint 10.a, similarly this constraint can be added as:

$$
\begin{equation*}
\sum_{t=t l+1}^{t=T} X_{j, t, s+3} \geq \operatorname{pbin}_{j, s+3} * X_{j, t 1, s} j=1, \ldots ., J \quad t 1=1, \ldots, T-1 \quad s=1, \ldots \ldots, S \tag{10.c}
\end{equation*}
$$

These six constraints (9.a, 9.b, 9.c, 10.a, 10.b and 10.c) strictly arrange starting and finishing periods of each stage of every job. In order to visualize it, these constraints force the schedule to be like in Figure 21. Constraints construct two imaginary lines such as red lines in the Figure 21 for each stage of every job. One works as a minimum border of starting points of stages and the other works as a maximum border of finishing points of each stage. By these constraints, model forces the schedules to be between these imaginary lines.

| Job \# | Stage \# | 1 | 2 | 3 | 4 | $\square$ | $\longrightarrow$ | T-1 | TIME HORIZON = T |

Figure-21: Schedule Visualization after Constraints 9.a, 9.b, 9.c, 10.a, 10.b and 10.c.
11. Additionally, three special cases for time period $=1$ should be handled. These constraints ensures not to start $\mathrm{s}+1^{\mathrm{st}}, \mathrm{s}+2^{\text {nd }}$ and $\mathrm{s}+3^{\text {rd }}$ stages of each job at time period $=1$ if there is a process time at stage s . They are easily added to model as following:

$$
\begin{array}{ll}
\operatorname{pbin}_{j, s} * X_{j, 1, s+1}=0 j=1, \ldots, J & s=1, \ldots, S \quad(11 . a) \\
\text { pbin }_{j, s} * X_{j, 1, s+2}=0 j=1, \ldots, J & s=1, \ldots, S \quad(11 . b) \\
\text { pbin }_{j, s} * X_{j, 1, s+3}=0 j=1, \ldots, J & s=1, \ldots, S \tag{11.c}
\end{array}
$$

12.Also, there are three special cases for time period $=60$ that should be handled. These three constraints ensures $s{ }^{\text {th }}$ stage of each job not to end at time period $=60$ before $s+1^{\text {st }}, s+2^{\text {nd }}$ and $s+3^{\text {rd }}$ stages if there are process times at $\mathrm{s}+1^{\text {st }}, \mathrm{s}+2^{\text {nd }}$ or $\mathrm{s}+3^{\text {rd }}$ stages. Here are these constraint: $\operatorname{pbin}_{j, s+1} * X_{j, 60, s}=0 j=1, \ldots ., J \quad s=1, \ldots ., S \quad(12 . a)$

$$
\begin{array}{ll}
\operatorname{pbin}_{j, s+2} * X_{j, 60, s}=0 j=1, \ldots, J & s=1, \ldots ., S \\
\operatorname{pbin}_{j, s+3} * X_{j, 60, s}=0 j=1, \ldots ., J & s=1, \ldots \ldots, S \tag{12.c}
\end{array}
$$

After detailed demonstration of parameters, decision variables, constraints and objective function, whole proposed model for ASELSAN Defense Systems Technologies Division HFS Scheduling Problem seems like following:

## Index:

j = job number
$j=1, \ldots \ldots . J+1$
t = each time period
$t=1, \ldots . . T$
s = stage number
$s=1, \ldots . S$

## Parameters (Given-Data)

$\mathrm{p}_{\mathrm{j}, \mathrm{s}} \quad=$ process time of job j in stage s
$S T_{j, s}=$ setup time of job j in stage s
T = Time Horizon
$r d_{j} \quad=$ release date of job $j$
$d_{j} \quad=$ due date of $j o b j$
$\operatorname{minC}_{\mathrm{s}, \mathrm{t}} \quad=$ minimum capacity level at each stage and in each time period
$\max _{\mathrm{s}, \mathrm{t}}=$ maximum capacity level at each stage and in each time period
$\mathrm{pbin}_{\mathrm{j}, \mathrm{s}} \quad=1$ if there is a process time of job j at stage s
0 otherwise

TH = Time Horizon
CC= Capacity cost for each increment
TJC = Cost paid for each Tardy job

BigM = Big number

## Decision Variables:

$X_{j, s, t}=1 ; \quad$ if $s$ th stage of job j is being done in period t ;
0 ; otherwise
$\mathrm{S}_{\mathrm{j}, \mathrm{s}, \mathrm{t}}=1$; if a setup occurs at s th stage of job j is completed in period t 0 ; otherwise
$C_{t, s}=$ capacity at each stage in $t$ th time period.
$F_{j} \quad=$ Completion time of $j$ th job.
$T A_{j}=1$; if Finish time is greater than due date of each job. $\left(F_{j}>d d_{j}\right)$
0; otherwise

## Complete Proposed Model for T=60 and S=4:

Minimize $\quad Z=\sum_{j=1}^{J} T J C * \mathrm{TA}_{\mathrm{j}}+\sum_{j=1}^{J} \mathrm{CC} *\left(\mathrm{C}_{\mathrm{t}, \mathrm{s}}-\operatorname{minC}_{\mathrm{t}, \mathrm{s}}\right)$
Subject to:

$$
\begin{align*}
& F_{j} \leq T \quad j=1, \ldots, J  \tag{1}\\
& \left(X_{j, t, s} * t\right)+\left(S_{j, t, s} * S T_{j, s}\right) \leq F_{j} \quad j=1, \ldots ., J \quad t=1, \ldots . T \quad s=1, \ldots . S  \tag{2}\\
& \sum_{t=1}^{T} X_{j, t, s}=p_{j, s} \quad j=1, \ldots ., J \quad s=1, \ldots ., S  \tag{3}\\
& X_{j, t, s}-X_{j, t-1, s} \leq S_{j, t, s} \quad j=1, \ldots ., J \quad t=1, \ldots . T \quad s=1, \ldots . S  \tag{4}\\
& \text { pbin }_{j, s} * X_{j, t, s} * r d_{j} \leq t * X_{j, t, s} \quad j=1, \ldots ., J \quad t=1, \ldots . T \quad s=1, \ldots . S  \tag{5}\\
& C_{t, s} \leq \max C_{t, s} \quad t=1, \ldots . T \quad s=1, \ldots . S \quad \text { (6) } \\
& F_{j}-d d_{j} \leq \operatorname{BigM} * T A_{j} \quad j=1, \ldots . J  \tag{7}\\
& \sum_{j=1}^{J}\left(X_{j, t, s}+\left(S_{j, t, s} * S T_{j, s}\right) \leq C_{t, s} \quad t=1, \ldots ., T \quad s=1, \ldots ., S\right.  \tag{8}\\
& \sum_{t=1}^{t=t 1} X_{j, t, s} \geq \operatorname{pbin}_{j, s} * X_{j, t 1+1, s+1} j=1, \ldots, J \quad t 1=1, \ldots, T-1 \quad s=1, \ldots, S  \tag{9.a}\\
& \sum_{t=1}^{t=t 1} X_{j, t, s} \geq \text { pbin }_{j, s} * X_{j, t+1+, s+2} j=1, \ldots ., J \quad t 1=1, \ldots, T-1 \quad s=1, \ldots ., S  \tag{9.b}\\
& \sum_{t=1}^{t=t 1} X_{j, t, s} \geq \operatorname{pbin}_{j, s} * X_{j, t l+1, s+3} j=1, \ldots ., J \quad t 1=1, \ldots, T-1 \quad s=1, \ldots ., S  \tag{9.c}\\
& \sum_{t=t l+1}^{t=T} X_{j, t, s+1} \geq \operatorname{pbin}_{j, s+1} * X_{j, t 1, s} j=1, \ldots ., J \quad t 1=1, \ldots, T-1 \quad s=1, \ldots ., S \\
& \sum_{t=t l+1}^{t=T} X_{j, t, s+2} \geq \text { pbin }_{j, s+2} * X_{j, t 1, s} j=1, \ldots ., J \quad t 1=1, \ldots, T-1 \quad s=1, \ldots ., S \quad(10 . b) \\
& \sum_{t=t 1+1}^{t=T} X_{j, t, s+3} \geq \operatorname{pbin}_{j, s+3} * X_{j, t 1, s} j=1, \ldots, J \quad t 1=1, \ldots, T-1 \quad s=1, \ldots, S \\
& \operatorname{pbin}_{j, s} * X_{j, 1, s+1}=0 j=1, \ldots ., J \quad s=1, \ldots ., S \quad \text { (11.a) } \\
& \operatorname{pbin}_{j, s} * X_{j, 1, s+2}=0 j=1, \ldots ., J \quad s=1, \ldots ., S \quad \text { (11.b) } \\
& \operatorname{pbin}_{j, s} * X_{j, 1, s+3}=0 j=1, \ldots ., J \quad s=1, \ldots, S \quad \text { (11.c) } \\
& \text { pbin }_{j, s+1} * X_{j, 60, s}=0 j=1, \ldots ., J \quad s=1, \ldots ., S \quad \text { (12.a) } \\
& \text { pbin }_{j, s+2} * X_{j, 60, s}=0 j=1, \ldots ., J \quad s=1, \ldots ., S \quad \text { (12.b) } \\
& \operatorname{pbin}_{j, s+3} * X_{j, 60, s}=0 j=1, \ldots ., J \quad s=1, \ldots ., S \quad(12 . c) \\
& X_{j, t, s}=\{0,1\} \quad S_{j, t, s}=\{0,1\} \quad \mathrm{TA}_{\mathrm{j}}=\{0,1\} \quad E A_{\mathrm{j}}=\{0,1\} \\
& F_{j} \geq 0 \\
& C_{t, s} \geq 0
\end{align*}
$$

## 4. COMPUTATIONAL RESULTS AND DISCUSSION

The MIP model, developed in this research for ASELSAN Defense Systems Technologies Division HFS Scheduling Problem, is programmed at GAMS Integrated Development Environment 23.7.3 version. With real-data acquired from the company, it is ran in PC that has Windows 7 Home Premium 64-Bit Operating System, Intel Core i3 2.53 GHz CPU, 3 GB RAM and it is solved with CPLEX Solver in GAMS. The written MIP program is updatable from Microsoft Excel therefore many real scenarios developed for the company are tried and solved easily in the program. And also program is able to screen results to Microsoft Excel.

In order to evaluate the scalability of the program, from easiest to hardest 9 numerical examples has been created and tried to solve such as:

|  | Stage \# | Job \# | Time Horizon |
| :---: | :---: | :---: | :---: |
| 1 | 2 | 4 | 4 |
| 2 | 3 | 6 | 8 |
| 3 | 4 | 6 | 8 |
| 4 | 4 | 15 | 20 |
| 5 | 4 | 30 | 20 |
| 6 | 4 | 60 | 60 |
| 7 | 4 | 110 | 60 |
| 8 | 4 | 152 | 60 |
| 9 | 4 | 160 | 60 |

Table 3: Properties of Solved Examples
During solving hard examples, best possible solutions so far at time 5, 10 and 20 minutes are taken and demonstrated in this research in order to evaluate at what time and at which percentage that proposed MIP model get closer to objective function. Also, characteristics and run-times of examples are demonstrated in this research so as to test speed of the proposed MIP model.

After solving these imaginary cases for testing proposed-MIP model, a real scheduling case is solved depending on real-data taken from ASELSAN Defense Systems Technologies Division.

For all of these examples, in order to simulate realistic cases, coordinated with the company, tardy job cost has been determined as TJC $=20.000$, and capacity increment cost has been determined as $C C=100 \$$. Additionally, capacity level and maximum capacity borders for all periods have been determined such as:

|  | Stage 1 |  | Stage 2 |  | Stage 3 |  | Stage 4 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{array}{l}\text { Time } \\ \text { Period }\end{array}$ | $\begin{array}{c}\text { Normal } \\ \text { Limit }\end{array}$ | Max. | $\begin{array}{c}\text { Normal } \\ \text { Limit }\end{array}$ | Max. | $\begin{array}{c}\text { Normal } \\ \text { Limit }\end{array}$ | Max. | $\begin{array}{c}\text { Normal } \\ \text { Limit }\end{array}$ |  |
| $\mathbf{1 \rightarrow t}$ | 8 | 12 | 20 | 40 | 5 | 11 | 2 |  |$] 8$.

But as mentioned before, for the proposed model, different capacity level for each period and for each stage can be determined due to different production environments and conditions.

This is a minimization problem therefore all of objective values can be less than $0(-)$ too. That negative amount can be regarded as positive profit that is gained from the optimal schedules.

## Run-Results of 10 Numerical Examples:

## 1. Numerical Example:

For 2 stages, 4 jobs and 4 time horizon; process times and setup times are determined such as:

|  |  | Process Times |  |  | Setup Times |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Pr. <br> Orders | Release <br> Dates | Due <br> Dates | Stage <br> $\mathbf{1}$ | Stage <br> $\mathbf{2}$ | Stage <br> $\mathbf{1}$ | Stage <br> $\mathbf{2}$ |
| $\mathbf{j 1}$ | 0 | 5 | 0 | 2 | 0 | 2 |
| $\mathbf{j} 2$ | 1 | 5 | 3 | 1 | 2 | 0 |
| $\mathbf{j 3}$ | 0 | 4 | 0 | 3 | 0 | 1 |
| $\mathbf{j 4}$ | 0 | 4 | 2 | 1 | 3 | 1 |

Execution Statistics has been just like this:

## BLOCKS OF EQUATIONS <br> 17 SINGLE EQUATIONS

BLOCKS OF VARIABLES
6
SINGLE VARIABLES

NON ZERO ELEMENTS

OBJECTIVE VALUE = -9.100

Run Time $=0.05 \mathrm{Sec}$
Proposed MIP model results an optimal schedule just like following:

| OPTIMAL SCHEDULE |  |  |  |
| :--- | :--- | ---: | ---: |
| Job\# | Time \# | Stage 1 | Stage 2 |
| j1 | t1 | 0 | 1 |
| j1 | t2 | 0 | 1 |
| j2 | t1 | 1 | 0 |
| j2 | t2 | 1 | 0 |
| j2 | t3 | 1 | 0 |
| j2 | t4 | 0 | 1 |
| j3 | t2 | 0 | 1 |
| j3 | t3 | 0 | 1 |
| j3 | t4 | 0 | 1 |
| j4 | t1 | 1 | 0 |
| j4 | t2 | 1 | 0 |
| j4 | t3 | 0 | 1 |

Completion times and due dates of each job are like this:

| Job \# | Completion <br> Time | Due <br> Dates |
| :--- | :--- | :--- |
| j1 | 3 | 5 |
| j2 | 4 | 5 |
| j3 | 4 | 4 |
| j4 | 4 | 4 |

As it is seen no tardy jobs occur in optimal schedule.
For optimal schedule, capacity level for each stage at each time period has been like this:

CAPACITY LEVEL AT EACH TIME PERIOD

| Time \# | Stage 1 | Stage 2 |
| :---: | :---: | :---: |
| $\mathbf{t 1}$ | 7 | 3 |
| $\mathbf{t 2}$ | 2 | 3 |
| $\mathbf{t 3}$ | 1 | 3 |
| $\mathbf{t 4}$ | 0 | 2 |

## 2. Numerical Example:

For 3 stages, 6 jobs and 8 time horizon; process times and setup times are determined such as:

|  |  |  | Process Times |  |  | Setup Times |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Pr. Orders | Release Dates | Due Dates | Stage 1 | Stage 2 | Stage 3 | Stage 1 | Stage 2 | Stage 3 |
| j1 | 0 | 8 | 0 | 0 | 2 | 0 | 0 | 0 |
| j2 | 1 | 7 | 0 | 0 | 5 | 0 | 0 | 1 |
| j3 | 0 | 8 | 0 | 3 | 3 | 0 | 1 | 1 |
| j4 | 0 | 9 | 2 | 1 | 0 | 3 | 1 | 0 |
| j5 | 0 | 9 | 2 | 0 | 1 | 1 | 0 | 1 |
| j6 | 1 | 9 | 1 | 3 | 2 | 2 | 1 | 1 |

Execution Statistics has been just like this:

| :---: | :---: | :---: | :---: | :---: | :---: |
| j1 | t5 | 0 | 0 | 1 | 0 |
| j1 | t6 | 0 | 0 | 1 | 1 |
| j1 | t7 | 0 | 0 | 1 | 1 |
| j1 | t8 | 0 | 0 | 0 | 1 |
| j2 | t1 | 1 | 0 | 0 | 0 |
| j2 | t2 | 0 | 1 | 0 | 0 |
| j2 | t3 | 0 | 1 | 0 | 0 |
| j2 | t4 | 0 | 1 | 0 | 0 |
| j2 | t5 | 0 | 0 | 1 | 0 |
| j2 | t6 | 0 | 0 | 1 | 0 |
| j2 | t7 | 0 | 0 | 0 | 1 |
| j3 | t3 | 1 | 0 | 0 | 0 |
| j3 | t5 | 0 | 1 | 0 | 0 |
| j3 | t6 | 0 | 0 | 1 | 0 |
| j3 | t7 | 0 | 0 | 0 | 1 |
| j4 | t1 | 0 | 1 | 0 | 0 |
| j4 | t6 | 0 | 0 | 0 | 1 |
| j5 | t1 | 0 | 0 | 1 | 0 |
| j5 | t5 | 0 | 0 | 0 | 1 |
| j6 | t1 | 1 | 0 | 0 | 0 |
| j6 | t2 | 0 | 1 | 0 | 0 |
| j6 | t3 | 0 | 1 | 0 | 0 |
| j6 | t4 | 0 | 1 | 0 | 0 |
| j6 | t6 | 0 | 0 | 1 | 0 |
| j6 | t7 | 0 | 0 | 1 | 0 |
| j6 | t8 | 0 | 0 | 0 | 1 |

Completion times and due dates of each job are like this:

| Job \# | Completion <br> Time | Due <br> Dates |
| :--- | :--- | :--- |
| j 1 | 8 | 8 |
| j 2 | 7 | 7 |
| j 3 | 8 | 8 |
| j 4 | 7 | 9 |
| j 5 | 6 | 9 |
| j 6 | 9 | 9 |

As it is seen no tardy jobs occur in optimal schedule.

For optimal schedule, capacity level for each stage at each time period has been like this:

| CAPACITY LEVEL AT EACH TIME PERIOD |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Time \# | Stage 1 | Stage 2 | Stage 3 | Stage 4 |
| $\mathbf{t 1}$ | 8 | 2 | 2 | 0 |
| $\mathbf{t 2}$ | 1 | 6 | 0 | 0 |
| $\mathbf{t 3}$ | 3 | 3 | 2 | 0 |
| $\mathbf{t 4}$ | 0 | 3 | 1 | 0 |
| $\mathbf{t 5}$ | 0 | 2 | 3 | 2 |
| $\mathbf{t 6}$ | 0 | 0 | 6 | 4 |
| $\mathbf{t 7}$ | 0 | 0 | 2 | 4 |
| $\mathbf{t 8}$ | 0 | 0 | 0 | 3 |

## 4. Numerical Example:

For process times and setup times of 4 stages, 15 jobs and 20 time horizon, please look at Appendix-1 Table 1- Process times and Setup times of $4^{\text {th }}$ Numerical Example

Execution Statistics has been just like this:

BLOCKS OF EQUATIONS 129

BLOCKS OF VARIABLES

NON ZERO ELEMENTS 64,795

SINGLE EQUATIONS
9,116

SINGLE VARIABLES2,511

DISCRETE VARIABLES

OBJECTIVE VALUE = -59.000

## Run Time $=0.23$ Sec

For optimal schedule output, please look at Appendix-1 Table 2- Optimal Schedule Output
For Completion times and due dates of each job, please look at Appendix-1
Table 3- Completion times and Due Dates Output
As it is seen no tardy jobs occur in optimal schedule.
For capacity level for each stage at each time period, please look at Appendix-1
Table 4- Capacity Level for Each Stage Output

## 5. Numerical Example:

For process times and setup times of 4 stages, 30 jobs and 20 time horizon, please look at Appendix-2 Table 1- Process times and Setup times of $5^{\text {th }}$ Numerical Example

Execution Statistics has been just like this:
BLOCKS OF EQUATIONS 129 SINGLE EQUATIONS 18,064
BLOCKS OF VARIABLES 6 SINGLE VARIABLES 4,941

NON ZERO ELEMENTS 129,485 DISCRETE VARIABLES 4,830

OBJECTIVE VALUE = -48.400

## Run Time $=0.48 \mathrm{Sec}$

For optimal schedule output, please look at Appendix-2 Table 2- Optimal Schedule Output

For Completion times and due dates of each job, please look at Appendix-2 Table 3- Completion times and Due Dates Output

As it is seen no tardy jobs occur in optimal schedule.
For capacity level for each stage at each time period, please look at Appendix2 Table 4- Capacity Level for Each Stage Output

## 6. Numerical Example:

For process times and setup times of 4 stages, 60 jobs and 60 time horizon; please look at Appendix-3 Table 1- Process times and Setup times of $6^{\text {th }}$ Numerical Example

Execution Statistics has been just like this:

## BLOCKS OF EQUATIONS 369 SINGLE EQUATIONS 108,316

BLOCKS OF VARIABLES 6 SINGLE VARIABLES 29,161
NON ZERO ELEMENTS 2,073,541 DISCRETE VARIABLES 28,860

OBJECTIVE VALUE = $\quad-164.400$

Total Run-Time $=\mathbf{4 7 , 4 2}$ Seconds
For optimal schedule output, please look at Appendix-3 Table 2- Optimal Schedule Output

For Completion times and due dates of each job, please look at Appendix-3 Table 3- Completion times and Due Dates Output

As it is seen no tardy jobs occur in optimal schedule.

For capacity level for each stage at each time period, please look at Appendix-3
Table 4- Capacity Level for Each Stage Output

## 7. Numerical Example:

For process times and setup times of 4 stages, 110 jobs and 60 time horizon; please look at Appendix-4 Table 1- Process times and Setup times of $7^{\text {th }}$ Numerical Example

Execution Statistics has been just like this:

BLOCKS OF EQUATIONS 369 SINGLE EQUATIONS 198,076
BLOCKS OF VARIABLES 6 SINGLE VARIABLES 53,261

NON ZERO ELEMENTS
3,800,719 DISCRETE VARIABLES
52,910

OBJECTIVE VALUE =-129.200
Total Run-Time = 169.28 Seconds

For optimal schedule output, please look at Appendix-4 Table 2- Optimal Schedule Output

For Completion times and due dates of each job, please look at Appendix-4 Table 3- Completion times and Due Dates Output

As it is seen no tardy jobs occur in optimal schedule.

For capacity level for each stage at each time period, please look at Appendix-4 Table 4- Capacity Level for Each Stage Output

It is seen that for 110 jobs, model can find optimal schedule in 170 Sec. Therefore, no additional solution is taken during execution.

## 8. Numerical Example:

For process times and setup times of 4 stages, 152 jobs and 60 time horizon; please look at Appendix-5 Table 1- Process times and Setup times of $8^{\text {th }}$ Numerical Example

Execution Statistics has been just like this:

| BLOCKS OF EQUATIONS | 369 | SINGLE EQUATIONS | 273,554 |
| :--- | :---: | :--- | :---: |
| BLOCKS OF VARIABLES | 6 | SINGLE VARIABLES | 73,505 |
| NON ZERO ELEMENTS | $5,249,831$ | DISCRETE VARIABLES | 73,110 |
| OBJECTIVE VALUE | $=\mathbf{- 1 0 0 . 4 0 0}$ |  |  |
| Total Run-Time | $=\mathbf{1 . 2 8 9 , 5 3}$ Seconds $/ \mathbf{2 0}$ Min. $\mathbf{8 9}$ Sec. |  |  |

For optimal schedule output, please look at Appendix-5 Table 2- Optimal Schedule Output

For Completion times and due dates of each job, please look at Appendix-5 Table 3- Completion times and Due Dates Output

As it is seen no tardy jobs occur in optimal schedule.
For capacity level for each stage at each time period, please look at Appendix-5
Table 4- Capacity Level for Each Stage Output
As mentioned before, additional to optimal schedule, at time 5, 10 and 20 minutes best solutions so far are saved. These solutions that are taken from model have been:

|  | 300 Sec | 600 Sec. | 1200 Sec. | Optimal Solution |
| :---: | :---: | :---: | :---: | :---: |

| Best Objective So Far | -110.711 | -107.420 | -104.118 | $\begin{gathered} \text { Obj. Value }=-100.400 \\ \text { Run Time }=1.290 \text { Sec. } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: |
|  | \% 10 | \% 7 | \% 3,7 |  |

## 9. Numerical Example:

For process times and setup times of 4 stages, 160 jobs and 60 time horizon; please look at Appendix-6 Table 1- Process times and Setup times of $9^{\text {th }}$ Numerical Example

After execution, it is seen that model cannot solve such a large problem like this. No optimal schedule is generated. In order to observe the limits of model, it is seen that for 152 jobs, optimal schedule is generated however for 153 jobs, optimal schedule cannot be generated. Therefore, it is observed that for 4 stages and 60 time horizon, proposed model has 152 jobs limit.

## Run-Result of a Real Scheduling Case of the Company:

After demonstrating that the proposed model has the ability of solving scheduling problems up to 152 jobs, for 4 stages and for 60 time horizon, model has been tried on a real scheduling problem based on real data of production orders and capacity limits that are given by the company.

In 15.02.2013, a snapshot of all jobs in production is taken from the company for testing our model. There were 124 jobs in this case and company wanted to obtain an optimal schedule for 60 time periods/4 work hours (30 days/1.5 Months). For process times and setup times of real-life example, please look at Appendix-7 Table 1- Process times and Setup times of Real-Life Example

Normal capacity level and max capacity level during periods was like following:

|  | Stage 1 |  | Stage 2 |  | Stage 3 |  | Stage 4 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Time <br> Period | Normal <br> Limit | Max. | Normal <br> Limit | Max. | Normal <br> Limit | Max. | Normal <br> Limit | Max. |

| $\mathbf{t 5 9}$ | 8 | 12 | 20 | 30 | 10 | 20 | 2 | 8 |
| $\mathbf{t 6 0}$ | 8 | 12 | 20 | 30 | 10 | 20 | 2 | 8 |

Model has been run and execution statistics has been just like this:
BLOCKS OF EQUATIONS 369 SINGLE EQUATIONS 222,963
BLOCKS OF VARIABLES
6 SINGLE VARIABLES 60,009
NON ZERO ELEMENTS
OBJECTIVE VALUE =-116.800

Run Time $=$ 237.73 Seconds
For optimal schedule output, please look at Appendix-7 Table 2- Optimal Schedule Output

For Completion times and due dates of each job, please look at Appendix-7
Table 3- Completion times and Due Dates Output
As it is seen, all due date constraints are met.

For capacity level for each stage at each time period, please look at Appendix-7
Table 4- Capacity Level for Each Stage Output

## Discussion

As it is demonstrated in 9 numerical examples and a real scheduling case of ASELSAN Defense Systems Technologies Division, proposed model has ability of solving real life Hybrid Flow Shop Scheduling problems of the company up to 153 production orders.

For 9 numerical examples and real life case, following results has been gathered:

| Problem Type |  |  |  | SOLUTION RESULTS |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Stage \# | $\begin{gathered} \text { Job } \\ \# \end{gathered}$ | Time Horizon | Discrete Var. | Equations | Nonzero Elements | Objective Value | Run Time (Sec.) |
| 1 | 2 | 4 | 4 | 68 | 169 | 423 | -9.100 | 0,05 |
| 2 | 3 | 6 | 8 | 290 | 1.033 | 3.579 | -7.900 | 0,02 |
| 3 | 4 | 6 | 8 | 390 | 1.485 | 5.481 | -8.700 | 0,01 |
| 4 | 4 | 15 | 20 | 2.415 | 9.116 | 64.795 | -59.000 | 0,23 |
| 5 | 4 | 30 | 20 | 4.830 | 18.064 | 129.485 | -48.400 | 0,48 |
| 6 | 4 | 60 | 60 | 28.860 | 108.316 | 2.073.541 | -164.400 | 47,42 |
| 7 | 4 | 110 | 60 | 52.910 | 198.076 | 3.800 .719 | -129.200 | 169,28 |
| 8 | 4 | 152 | 60 | 73.110 | 273.554 | 5.249 .831 | -100.400 | 1.289,53 |
| Real Case ${ }^{9}$ | 4 4 | $\begin{aligned} & \hline 160 \\ & 124 \\ & \hline \end{aligned}$ | $\begin{aligned} & 60 \\ & 60 \\ & \hline \end{aligned}$ | Unavalible 59,64 | Unavalible 222,963 | Unavalible 4,258,716 | Unavalible $-116.800$ | Unavalibl 237.73 |

For 152 jobs, 4 stages and 60 time horizons, it takes $\sim 20 \mathrm{~min}$. to solve the problem but it can find an optimal. According to real life experiences of ASELSAN Defense Systems Technologies Division Production Department, maximum load of production is average 140-150 production orders. Also, it is seen from the results of the model, there are no tardy jobs in the optimal schedules. There are early jobs because of not including "Cost for early jobs". Model arranges all of the jobs due to tardy-job costs and capacity increment costs. Additionally, run-time of the model is short enough for fast re-scheduling and taking action immediately. It takes from 2 to 5 minutes for solving an average real-life case of ASELSAN Defense Systems Technologies Division. Therefore, proposed model in this research can be used as a decision support tool, for optimizing the schedules and deciding lot-splitting, capacity increment and due date strategies for each production order.

## 5. CONCLUSION AND FUTURE RESEARCH

In this research, for ASELSAN Defense Systems Technologies Division Production Scheduling Problem is examined and a Mixed Integer Program is proposed, demonstrated, and tested for numerical and real-life examples. As it is mentioned before, briefly ASELSAN Defense Systems Technologies Division Production Department Printed Wiring Board Production area has main 4 stages:
a. SMD Assembly
b. Through Hole Component Assembly and Rework
c. Functional Test
d. Conformal Coating and Gluing

Each stage has parallel labor and machine resources. All of labor and machine resources that are at the same stage are identical. Lot splitting is allowed in each stage. There are unlimited buffer between stages. Because of High Mix/low Volume, set-up times are inevitable and setup time of each job is independent from other jobs' setup times. (sequence - independent). And whenever lot of a production order is split to sub-lots, new setup time occurs for that stage.

Each production order has its own release date, due date, process and setup times for each stage. During manufacturing execution, capacity of each stage can be changed and lots of production orders can be divided to sub-lots due to scheduling strategies in line with the release date, due-date and capacity borders. ASELSAN Defense Systems Technologies Division Production Department mainly wants to minimize sum of total cost of tardy jobs and total cost of capacity increments. Therefore, briefly company has needed a decision support tool for its scheduling problem that gives optimal or near-optimal schedules corresponding to cost constraints.

The scheduling problem of ASELSAN Defense Systems Technologies Division is named as Hybrid Flow Shop Scheduling problem in literature. As it mentioned in (Gupta, 1988; VoX, 1993), it has m stage, each stage has parallel resources and each job follows the same routing. Corresponding to notation given in (Rubén Ruiz, José Antonio Vázquez-Rodríguez, 2009), this specific scheduling problem of the company is denoted as:

## FHm (PM $\left.{ }^{(k)}\right)^{m}{ }_{k=1} \mid r_{j}$, split, $S_{\text {nsd }} \mid \mathbf{U}+$ Total Capacity

It is observed in (Rubén Ruiz, José Antonio Vázquez-Rodríguez, 2009) that this kind of problems can be solved by Exact Methods (such as Branch \& Bound Algorithms, Integer Programming) and Heuristics/Meta-heuristics. In order to find exact optimal schedules for the company, Mixed Integer Programming method is chosen and a comprehensive Mixed Integer Program is built in GAMS Integrated Development Environment 23.7.3 version, solved by CPLEX solver and tested for 9 numerical and 1 real-life examples in this research. Summary of the results of examples can be seen at the table below:

| Problem Type |  |  |  | SOLUTION RESULTS |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Stage \# | $\begin{gathered} \text { Job } \\ \# \end{gathered}$ | Time Horizon | Discrete Var. | Equations | Nonzero Elements | Objective Value | Run Time (Sec.) |
| 1 | 2 | 4 | 4 | 68 | 169 | 423 | -9.100 | 0,05 |
| 2 | 3 | 6 | 8 | 290 | 1.033 | 3.579 | -7.900 | 0,02 |
| 3 | 4 | 6 | 8 | 390 | 1.485 | 5.481 | -8.700 | 0,01 |
| 4 | 4 | 15 | 20 | 2.415 | 9.116 | 64.795 | -59.000 | 0,23 |
| 5 | 4 | 30 | 20 | 4.830 | 18.064 | 129.485 | -48.400 | 0,48 |
| 6 | 4 | 60 | 60 | 28.860 | 108.316 | 2.073.541 | -164.400 | 47,42 |
| 7 | 4 | 110 | 60 | 52.910 | 198.076 | 3.800 .719 | -129.200 | 169,28 |
| 8 | 4 | 152 | 60 | 73.110 | 273.554 | 5.249 .831 | -100.400 | 1.289,53 |
| Real Case 9 | 4 | $\begin{aligned} & 160 \\ & 124 \end{aligned}$ | $\begin{aligned} & 60 \\ & 60 \end{aligned}$ | Unavalible $59,64$ | Unavalible 222,963 | Unavalible $4,258,716$ | Unavalible $-116.800$ | Unavalible $237.73$ |

It's demonstrated that it gives optimal schedules up to 153 jobs, 4 stages and 60 Time-periods. It should be added that no due-date violations occur in optimal schedules for all of 9 numerical and 1 real-life examples.

According to the information that is taken from the ASELSAN Defense Systems Technologies Division Production Department, company has average 120-130
and maximum 140-150 production orders load. This means that proposed model can be used easily as a scheduling support tool for choosing optimal or near-optimal schedules. Additionally, run-time of the model for 130-140 production orders is average $\sim 5$ minutes long and it is small enough to take action immediately and re-schedule if it is needed.

For future research, some additional features can be added to the model just like:

1. Obligatory Wait times (Owen, Washing etc) can be added to each stage.
2. For each stage and each period, minimum capacity border can be determined in order to make optimal schedules more realistic. Because in real-life, in most cases, equalizing capacity level of a stage to 0 , is impossible.
3. Early jobs and completion time objectives can be added.
4. Just In Time concept can be included at each stage by new constraints.
5. Advanced models can balance capacity level at each stage at each period by new constraints.

It is obvious that these features make the model more realistic, more accurate and more convenient to schedule real-life Hybrid Flow Shop Scheduling cases.

Table 4- Capacity Level for Each Stage Output

## CURRICULUM VITAE:

## EDUCATION

1999-2004 Bilkent University
Industrial Engineering (Undergraduate), Ankara
Full Scholarship Awarded
CGPA: 3.17/4.0

2010 Hacettepe University
Business Administration Faculty
Production Management (Graduate)
(Still continued)
CGPA: 3,69 / 4,0

WORK EXPERIENCE
(Compulsory Military Service has been accomplished.)
August 2005 - ,ASELSAN A.ş. Ankara/ Workshop Planning Senior Engineer and Lean Team Leader

- Providing production flow dynamically and interfering production problems as soon as possible, scheduling jobs for each workshop, capacity planning and balancing job allocations for different workshops.
- Additionally, leading Lean applications, preparing VSM and Kaizen Team Leader

November 2003 - May 2004, MAN Turkey A.ş., Ankara (Senior Project)

- Designing and Programming using C\# a Forklift Scheduling Program in order to improve material flow between assembly line and warehouse

August - September 2002, Kale Holding KaleData A.Ş., İstanbul (summer training)

- Marketing Research Project of Company

## SKILLS AND ABILITIES

## Computer Programming Languages:

Visual Basic (Very Good), C\# (good), Java (good), ASP.NET (good), SQL (good), Html (medium),

## Application Programs:

Microsoft Office (Excel, Access, Word, MS Project, MS Visio)(Advanced), Excel Macro (Good), ARENA Simulation Software (Advanced), GAMS Integer Programming Software (Advanced)

Language:
Advanced English, Intermediate German
CERTIFICATES

- Lean 5 S ve Visual Plant Applications, 2011
- Lean Hoshin Kanri and VSM Applications, 2011
- Microsoft Office Project , 2009
- Ranked Turkey $46^{\text {th }}$ in the University Entrance Exam, 1999
- Ranked Turkey $200^{\text {th }}$ in the Fen Liseleri Entrance Exam, 1996
- Tobitak Secondary School Math Olympiad Turkey 3 $3^{\text {rd }}, 1996$

## SOCIAL ACTIVITIES

- Founder and Organizer of ASELSAN Basketball Tournament, 2009-2012
- Coordinator and founder of IYEM (International Young Entrepreneurs Meeting) Organization-

FIRST in Turkey-, 2002

- Young Entrepreneurs Club President, 2002-2003
- Student Union Engineering Faculty Representative, 2000-2001 - General Secretary, 2001-2002

## Personal Traits

- Intelligent
- Creative
- Responsible

## Interests

- Lego Robotics designing
- Playing Basketball
- Playing guitar, listening music
