Received 8 July 2008; accepted 9 July 2008

Key indicators: single-crystal X-ray study;  $T = 120$  K; mean  $\sigma(C-C) = 0.003$  Å;  $R$  factor = 0.055;  $wR$  factor = 0.143; data-to-parameter ratio = 12.9.

The asymmetric unit of the title compound,  $C_{22}H_{19}FN_2O$ , contains two independent molecules. The planar benzimidazole ring systems are oriented with respect to the phenyl/fluorobenzene rings at dihedral angles of 31.10 (4)/45.17 (5) and 45.52 (5)/68.63 (5)°, respectively, for the two molecules. In the crystal structure, intermolecular C—H···N and intermolecular C—H···N and C—H···F hydrogen bonds link the molecules into a three-dimensional network. There are C—H···π contacts between the benzimidazole and fluorobenzene rings and a π—π contact between the benzimidazole and phenyl ring systems [centroid–centroind distance = 4.575 (1) Å].

## 1-[2-(4-Fluorobenzyloxy)-2-phenylethyl]-1*H*-benzimidazole

Ö. ÖZEL GÜVEN, T. ERDOĞAN, S. J. COLES AND T. HÖKELEK

### Comment

In recent years, there has been increasing interest in synthesis of heterocyclic compounds having biological and commercial importances. Clotrimazole (Song & Shin, 1998), econazole (Freer *et al.*, 1986), ketoconazole (Peeters *et al.*, 1979a) and miconazole (Peeters *et al.*, 1979b) are well known imidazole ring containing, while itraconazole (Peeters *et al.*, 1996) and fluconazole (Caira *et al.*, 2004) are 1*H*-1,2,4-triazole ring containing, azole derivatives. They have been developed for clinical uses as antifungal agents (Brammer & Feczkó, 1988). Lately, similar structures to miconazole and econazole have been reported to show antibacterial activity more than antifungal activity (Özel Güven *et al.*, 2007a,b). In these structures, benzimidazole ring has been found in place of the imidazole ring of miconazole and econazole. We report herein the crystal structure of title benzimidazole derivative.

The asymmetric unit of the title compound (Fig. 1) contains two independent molecules, in which the bond lengths and angles are generally within normal ranges. The planar benzimidazole ring systems are oriented with respect to the phenyl and fluorobenzene rings at dihedral angles of 31.10 (4) $^{\circ}$ , 45.17 (5) $^{\circ}$  and 45.52 (5) $^{\circ}$ , 68.63 (5) $^{\circ}$  for unprimed and primed molecules, respectively. Atoms C8, C9, C16 and C8', C9', C16' are -0.105 (2), 0.065 (2), -0.060 (2) and -0.163 (2), -0.088 (2), 0.009 (2) Å away from the ring planes of the corresponding benzimidazole, phenyl and fluorobenzene, respectively. So, they are nearly coplanar with the attached rings.

In the crystal structure, intramolecular C—H $\cdots$ N and intermolecular C—H $\cdots$ N and C—H $\cdots$ F hydrogen bonds (Table 1) link the molecules into a three dimensional network (Fig. 2), in which they may be effective in the stabilization of the structure. The C—H $\cdots$  $\pi$  contacts (Table 1) between the benzimidazole and the fluorobenzene rings and a  $\pi$  $\cdots$  $\pi$  contact between the benzimidazole and phenyl ring systems Cg1 $\cdots$ Cg6<sup>i</sup> [symmetry code: (i) 1 -  $x$ , 1/2 +  $y$ , 1/2 -  $z$ , where Cg1 and Cg6 are centroids of the rings (N1/N2/C1/C2/C7) and (C10'-C15'), respectively] further stabilize the structure, with centroid-centroid distance of 4.575 (1) Å.

### Experimental

The title compound was synthesized by the reaction of 2-(1*H*-benzimidazol-1-yl) -1-phenylethanol (Özel Güven *et al.*, 2007a) with NaH and appropriate benzyl halide. A solution of alcohol (300 mg, 1.259 mmol) in DMF (2.4 ml) was added to NaH (63 mg, 1.574 mmol) in small fractions. The appropriate benzyl halide (238 mg, 1.259 mmol) in DMF (1.2 ml) was added dropwise. The mixture was stirred at room temperature for 2 h, and the excess hydride was decomposed with a small amount of methyl alcohol. After evaporation to dryness under reduced pressure, the crude residue was suspended with water and extracted with methylene chloride. The organic layer was dried over anhydrous sodium sulfate, and then evaporated to dryness. The crude residue was purified by chromatography on a silica-gel column using chloroform-methanol as eluent. Crystals suitable for X-ray analysis were obtained by the recrystallization of the ether from a mixture of hexane/ethyl acetate (1:2) (yield; 364 mg, 83%).

$$\begin{aligned} \text{Extinction correction: SHELXL97 (Sheldrick, 2008),} \\ F_c^* = kF_c[1 + 0.001x F_c^2 \lambda^3 / \sin(2\theta)]^{1/4} \end{aligned}$$

Primary atom site location: structure-invariant direct methods

Extinction coefficient: 0.0237 (14)

Secondary atom site location: difference Fourier map

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
